State of the System Report

Fiscal Year 2011

Programming & System Analysis

www.maricopa.gov

INTRODUCTION

The 2011 State of the System Report (SOS) is a compilation of the physical inventory and status of the Maricopa County Department of Transportation's (MCDOT) infrastructure. It addresses roadway congestion, traffic safety, low volume road paving, bridges, and pavement conditions. Also, included are recommendations for future improvements within each of the infrastructure categories. The SOS report has been produced annually since 1998.

EXECUTIVE SUMMARY

Congestion Management System

Current and future roadway congestion is addressed in the Congestion Management System Report (CMS). The ratio of a roadway segment's current traffic volume as compared to its physical capacity (V/C Ratio) is used to determine its congestion level. The conservative method of measuring congestion as identified in the MCDOT Roadway Design Manual is used in the report. Roadways under the jurisdiction of MCDOT were analyzed with respect to their V/C ratios and their corresponding Levels of Service (LOS). Currently 22.5% of all arterial and collector roadway segments are at 86% or higher of their physical capacity.

Safety Management System

Safety conditions on MCDOT roadways are addressed under the Safety Management System Report (SMS). This report documents the intersection safety improvements made each year and those planned for the following year. In 2011 MCDOT completed 13 intersection safety improvements and has planned an additional 10 to be completed in 2012. The SMS also tracks the overall crash rates and crash history of MCDOT's roadways. In 2008, the latest date federal crash statistics were available, the crash rate for the nation as a whole was 2.2 crashes per Million Vehicle Miles of Travel (MVMT). In 2008 the County's overall crash rate was 1.49 per MVMT, considerably below the national average.

Low Volume Road Management System

Paving Low Volume Roads is an annual budgeted activity within MCDOT's Transportation Improvement Program (TIP). Dirt roadways are selected for paving based on criteria established by the MCDOT Transportation Advisory Board and the Federal Environmental Protection Agency through the Arizona Department of Environmental Quality. Since 1983 MCDOT has paved more than 453 miles of dirt roadways.

Bridge Management System

Bridges and other structures are identified in the Bridge Management System (BMS). In 2011 MCDOT maintains 420 bridges and structures. This includes 86 bridges and 334 culverts. Three new bridges and structures were added this year and two were removed through annexations by cities and towns. Bridges and structures are categorized as Federal or Non-Federal depending on their length. Those over 20 feet in length are classified as bridges. Those under 20 feet in length are classified as structures. Federal bridges and structures are rated on a 1-100 scale using the Federal Highway Administration's rating system. Those that have a rating between 50 and 80 are eligible for federal bridge rehabilitation funds. Bridges and structures rated below 50 are eligible for federal bridge replacement funds. In 2011 MCDOT has 23 bridges and structures rated between 50 and 80 and only one bridge rated below 50. The BMS lists all of MCDOT bridges and structures as well as their ratings.

Each year MCDOT must report the physical status of their bridges to the Board of Supervisors (BOS) in accordance with the Governments Accounting Standards Board Statement 34. The physical condition of MCDOT's bridges is within the targeted bridge sufficiency ratings (BSR) adopted by the BOS.

Criteria	Target Value	Actual Value
% of Bridges and Structures with BSR > 70	min. 90%	98.33%
% of Bridges & Structures with BSR < 50	max. 3%	0.24%

Roadway Management System

The Roadway Management System (RMS) is the pavement management program MCDOT uses to track and report on the physical attributes and conditions of all MCDOT paved roads. Two methods are used to measure a roadway's condition. The International Roughness Index (IRI) on a 1-500 scale and the Pavement Condition Rating (PCR) on a 1-100 scale. In 2011 81.01% of all roadways were rated Excellent to Good with respect to their PCR while only 0.61% were rated fair to poor. Using the IRI, 17.6% of MCDOT's roadways were rated Smooth to Very Smooth with 44.6% rated rough to very rough. This was accomplished through the adoption of a proactive pavement maintenance program designed to prolong the life of pavements and forestall the need for very expensive reconstruction as long as possible.

PCR Quality	PCR Range	Miles	Percent
Excellent to Very Good	> 70	901.58	81.01%
Fair to Poor	< 55	6.77	0.61%

Asset Management System

The Maricopa County and the Department of Transportation (MCDOT) maintains effective internal controls to manage its infrastructure assets, and to maintain proper records regarding the use and disposition of these assets. This is done to safeguard and maintain MCDOT's assets in order to receive the maximum benefit from these assets and to comply with State and Federal requirements regarding their use and disposition. MCDOT properly accounts each year for its infrastructure assets for financial reporting purposes in accordance with the Governments Accounting Standards Board (GASB) Statement 34.

MCDOT provides transparency as to how services are provided within the organization and to the County's constituents. It is the intent of the MCDOT Planning Division and Asset Management Team to educate, inform, develop and streamline Asset Management Reporting throughout MCDOT.

CONGESTION MANAGEMENT SYSTEM OVERVIEW AND BACKGROUND

Purpose of the CMS

The Maricopa County Congestion Management System (CMS) identifies existing and potential traffic congestion on Maricopa County roads.

The primary purposes for the County's CMS are:

1. To identify and measure traffic congestion on Maricopa County roads based on MCDOT's annual traffic count program.
2. To implement the goals in the County's Comprehensive Plan and the Major Streets and Routes Plan.
3. To improve the efficiency and safety of travel on Maricopa County roads.

Past MCDOT Congestion Management Efforts

MCDOT has developed and updated its CMS annually for the past 14 years. The CMS identifies congested roads based on the volume/capacity criteria established in the MCDOT Roadway Design Manual (RDM.)[1]

The adopted MCDOT Transportation System Plan (TSP) sets the overall policies, goals, and fundamental considerations for MCDOT decisions concerning current and future transportation needs and investments.

The TSP also recommends investment priorities based on three types of routes; primary, secondary and local. Much of the content of the TSP regarding CMS development and actions are a reflection of the County's Comprehensive Plan guidelines for transportation management.

CMS OBJECTIVES

Objectives Based on the Comprehensive Plan

The adopted Maricopa County Comprehensive Plan directs the management of the County's Public Works Department. The Plan calls for the coordination of development, conservation of natural resources, effective expenditures of public monies, and the promotion of the health, convenience and welfare of the County's citizens. Several objectives related to congestion are set forth in the Comprehensive Plan.

They include:

1. Reducing trips made in single occupancy vehicles.
2. Increasing transit ridership.
3. Employing technology to improve transportation facilities.
4. Identify and accommodate transportation corridors.

5. Optimize public investment.
6. Minimize travel times.

Objectives Based on the Transportation System Plan

The TSP provides guidance to manage the Maricopa County roadway network. The TSP goals set forth a vision for the planning and construction of transportation facilities in the County. The TSP includes several objectives to ease traffic congestion:

1. Roadway widening.
2. Intersection improvements.
3. Alternate route enhancement.
4. Establish parking rules that influence traffic congestion reduction.
5. Improvements to bicycle and pedestrian facilities.
6. Provide for both current and future traffic volume needs.
7. Monitor and measure congestion.
8. Help decide what improvements are needed.
9. Identify alternative actions.
10. Recommend cost-effective mitigation measures.
11. Evaluate actions related to congestion management.

CONGESTION EVALUATION PARAMETERS

Definition of Congestion

A widely accepted definition of traffic congestion is not firmly established because congestion is primarily a perceived condition rather than an absolute one. However, several definitions have been defined by various agencies.

The Federal Highway Administration's (FHWA) Interim Final Rule for the Management Systems element of the original ISTEA in 1991 defined congestion as "the level at which transportation system performance is no longer acceptable due to traffic interference."[1]

MCDOT Roadway Design Manual Definition

The MCDOT Roadway Design Manual (RDM) uses a combined functional classification and level of service (LOS) system for defining congestion. This provides a measure of congestion and the flexibility to view individual road segments based on their general characteristics and desired operation. To determine whether a segment is congested, a minimum desired LOS is first assigned based on its functional classification (Table 1). Local roads are classified at LOS A, collectors at B and C, and arterials at C and D depending on their urban or rural classification. Roadway capacities are established based on their desired minimum LOS and adjusted for their number of lanes. Their traffic volumes are then divided by their roadway capacities to see if they exceed the desired LOS.

The definition of congestion in the CMS is based on the operation of a roadway and the RDM standards. If traffic volumes exceed the RDM roadway capacity, the road is considered congested.

CMS Performance Measures

Accurate identification of congestion on roadway segments and intersections is critical to the effective management of the entire network. This CMS identifies road segments where congestion may be a problem.

MCDOT uses traffic volume to roadway capacity ratios (V/C) because they best identify congestion while satisfying County congestion management needs. These ratios typically use the average number of vehicles (in the most recent year) that travel a road per day divided by the number of vehicles that the road can reasonably handle per day, as per the RDM standards.

Area of Consideration

Geographically, the CMS is applied within the confines of Maricopa County and to roadways that are partially or completely under Maricopa County ownership or control. The MCDOT 2010 traffic count program includes counts on many of MCDOT's arterial and collector roadways.

CMS ANALYSIS PROCESS

This report uses the data from the annual 2010 MCDOT traffic count program and previous MCDOT traffic data. There were 813 arterial and collector roadway segments that were counted in 2010. Each roadway segment with a 2010 traffic count was compared to its 2006 count value. The absolute ADT increases or decreases were calculated along with each segment's positive or negative percentage change between 2006 and 2010. A roadway volume to capacity ratio was then calculated based on the number of lanes in each segment, the RDM recommended roadway capacity, and each segment's 2010 traffic count. The results are shown in Table 2.

FINDINGS AND RECOMMENDATIONS

The results of the 2010 MCDOT traffic count program are shown on Map 1. Currently 22.4% of MCDOT's arterial and collector roadway segments have a volume to capacity ratio of 0.86 or greater. This means that the 2010 traffic volumes on these roadway segments exceed 86% of the road's vehicle carrying capacity, according to the MCDOT RDM. The RDM criteria shown in Table 1 are very conservative with respect to capacity. This is done to give MCDOT ample warning of potential problems. Table 2 shows roadway segments with 2010 volume to capacity ratios > 70%.

A roadway's high V/C ratio may indicate a capacity problem. However, the solution may not be to immediately increase the capacity of the roadway. There may be multiple causes and solutions. For example, not having enough alternative routes parallel to a congested roadway may cause a temporary increase in traffic. A roadway may also be experiencing increased traffic due to construction or closures on alternative routes. Therefore, a thorough analysis of the roadway segments with high V/C ratios is required before there is a determination concerning which ones need immediate attention and which have high ratios due to other unseen or temporary factors. Detailed scoping studies may be necessary to further define solutions to the capacity problems identified in this report.

Table 1: MCDOT Roadway Design Manual Levels of Service and Volumes

Urban Roadway Level of Service and Service Volumes					
Road Classification	ADT/Lane	# Thru Lanes	2-Way ADT	Pk.Hr/ ADT%	Max Rdwy Length
Local	350	2	50 –1500	15	1,000 ft.
Minor Collector	2,500	2	500 - 5,000	12	½ mi.
Major Collector	3,500	2	600 - 8,500	10	2 mi.
Minor Arterial	5,500	4	5,000 - 35,000	8	--
Principal Arterial	7,500	6	30,000 - 60,000	8	--
Rural Roadway Level of Service and Service Volumes					
Road Classification	ADT/Lane	# Thru Lanes	2-Way ADT	Pk.Hr/ ADT%	Max Rdwy Length
Local	500	2	50- 1,500	15	1 mi.
Minor Collector	3,000	2	800 - 5,000	12	2 mi.
Major Collector	4,000	2	1,000 - 8,500	10	--
Minor Arterial	9,000	4	5,000 -35,000	10	--
Principal Arterial	10,000	4	10,000 - 40,000	10	--

SAFETY MANAGEMENT SYSTEM OVERVIEW AND BACKGROUND

PURPOSE OF THE SAFETY MANAGEMENT SYSTEM

The County Safety Management System (SMS) is a systematic process that has three goals.

- Document the safety improvements made by Maricopa County to specific intersections and road segments during the previous fiscal year.
- Identify the location, type, and severity of traffic crashes in the unincorporated portions of Maricopa County.
- Report trends in traffic crashes and recommend improvements to reduce the number and rate of crashes primarily at intersections.

MCDOT Safety Management Procedures

MCDOT makes every effort to respond quickly to identified intersection or roadway safety problems. These problems are frequently identified through public complaints about unsafe roadway conditions, first-hand observation by County staff members, and by reviewing recent crash records for county roadways. When an actual problem or potential problem is encountered, a detailed engineering analysis may be conducted with recommendation made as how to mitigate the situation. These recommendations are handled in three ways. Initially, through the MCDOT maintenance process for relatively simple and inexpensive solutions. More complex problems are handled by the MCDOT's Traffic Engineering Division. Complex problems involving significant changes that require substantial funding amounts are handles through the MCDOT's Transportation Improvement Program (TIP).

ANALYSIS OF MCDOT'S SPOT SAFETY IMPROVEMENTS FOR FYS 2010

Identifying and Ranking Low Cost Intersection Safety Improvements

The Manual on Uniform Traffic Control Devices (MUTCD) is used by MCDOT as the guide to determine whether an identified safety problem meets the criteria, also known as warrants, to move forward to become a project. The MUTCD provides a guide to install multi-way stop control or traffic signals when it is determined that five or more reported crashes at an intersection have occurred in a 12-month period, and are susceptible to correction by one or more traffic control alternatives. Other warrant factors may also be used to determine if an intersection needs improvements such as signalization, additional turn lanes, or other safety items.

SAFETY AUDIT PROGRAM

MCDOT Traffic Engineering is continuing its program to identify and evaluate roadway conditions and to prioritize and schedule improvements for upcoming years. This program is a continuation, at the local level, of the recently announced MAG initiative, also known as the Safety Audit Program. This program ensures that the latest safety standards are included in the designs for new roadways. A large percentage of MCDOT roadways were constructed 20 to 30 years ago with the design standards applicable at the time. The goal of this program is to be proactive in identifying those areas where current design standards may be more applicable.

Criteria to determine priorities includes accident history, average daily traffic, roadway function, posted speed, and already scheduled transportation improvement projects. Accident history is used to determine if improvements are required along roadways. Accident locations are plotted as indicated on the Arizona Department of Transportation (ADOT) accident reports. If five or more correctable accidents are detected within a roadway segment or intersection and occur within a 12 month period during the past three years, an engineering evaluation follows to determine what action, if any, should to be taken. Once projects meet the warrants criteria, projects are typically implemented in the order in which they have been identified for improvement.

SPOT SAFETY IMPROVEMENT PROJECT ACCOMPLISHMENTS FOR FY 2009

In 2011, 13 projects were completed (Table 1). These were implemented by the MCDOT Traffic Engineering Division. Ten projects were identified in FY 2012 for completion (Table 2).

EVALUATION OF SAFETY

MCDOT is continuing its ongoing process of analyzing locations that exhibit potential safety problems. The initial step each year is to examine the location and number of crashes, crash rates, injury severity, and the types of crashes occurring on the unincorporated roadways in Maricopa County. This was done for calendar year 2006. However, in 2007 the Arizona Department of Transportation changed their policies with respect to making crash data available. The new policy is to only allow jurisdictions to download from the ADOT website their own crash data and not the data of any other jurisdiction. Therefore, the County is currently attempting to acquire permissions from all the jurisdictions in the County to share their crash data.

OVERALL COUNTY CRASH RATES

Table 4 shows the relationship between the vehicle miles of travel per mile of County Roadway and the total roadway miles in the County system through 2008. Data will be added to this table for 2009, 2010 and 2011 when it becomes available. This table shows that the miles of County roadways are continuously declining primarily due to annexations, while the vehicle miles of travel on these remaining roadways are constantly increasing. The net result is ever increasing in congestion on the County roads.

The overall county crash rate is the best indicator to represent the history of the entire County system. The overall crash rate measures the number of crashes per million vehicle miles of travel (VMT) per mile of County-owned roadway per year in the unincorporated portions of the County. Table 5 shows that while the overall county crash rate has annually gone up and down, overall it has declined when compared to the increase in population in the unincorporated county. Since 1998 despite an increase of more than 53,000 people, more licensed drivers, and a rising number of miles traveled on County roadways, the crash rate for many types of crashes has declined.

ARTERIAL INTERSECTION SAFETY

MCDOT has approximately 1,500 intersections on its arterial roadway system that have experienced crashes in the past three years (2006-2008). Updated data for 2009-2010 will be added to this table when it becomes available from ADOT. Each of these intersection will be evaluated based on four safety criteria and given a score between 1 and 100. The higher the score the greater the safety concern.

The criteria to be used to evaluate and produce the overall MCDOT Safety Score includes:

- Crash Frequency (CF): The total number of crashes at an intersection over a three year period (2006-2008) divided by the intersection with the highest CF value of all MCDOT intersection.

- Crash Severity (CS): Crashes are rated by injury severity, i.e., fatal, incapacitating injury, non-incapacitating injury, possible injury and property damage only. Each value is given a weight and multiplied times the number of crashes in each category. The result is divided by the intersection with the highest CS value.

- Crash Type (CT): Crashes by collision manner for 2007 and 2008 were calculated. This is based on the average per vehicle cost at each MCDOT intersection for the 11 types of collision manner as listed in the Arizona Department of Transportation's crash statistics. This value is then divided by the highest CT value for all MCDOT intersections.

- Crash Rate (CR): This is the crash rate per million vehicles entering the intersection from all approaches.

The final MCDOT safety score was calculated with crash severity given twice the weight of the other criteria.

$$\text{Safety Score} = ((CF * .20)+(CS * .40)+(CT * .20)+(CR * .20))* 100$$

It is MCDOT's intent to accurately portray each of its arterial roadway intersections fairly by using these four criteria and weighting them most heaviest for crash severity. This methodology negates the influence of any one criteria, i.e., total number of crashes or crash rates on the final score. The top 50 intersections based on their MCDOT Safety Scores are listed in table 12.

Table 3. County Crash Rates 1998-2008

Factors	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008

Low Volume Road Management System

Fiscal Year 2011

Programming & System Analysis

www.maricopa.gov

TABLE OF CONTENTS

List of Tables

List of Figures

LOW VOLUME ROAD MANAGEMENT SYSTEM

The Maricopa County Department of Transportation (MCDOT) in FY 2004 initiated a formal program to pave low volume roads (LVR) in the County. A multi-year capital improvement program for paving low traffic volume dirt roadways was then created.

OVERVIEW

This report documents the number and miles of low volume roads paved by MCDOT in Fiscal Year 2011. It also provides an historical picture of all MCDOT low volume road paving since1983.

BACKGROUND

Prior to 2004 MCDOT paved low volume roads primarily based on citizen complaints and field observations by MCDOT staff. However, beginning in 2004, MCDOT initiated a program to systematically identify low volume dirt roadways for paving. Unpaved roads with high or increasing traffic volumes, safety issues, or other significant concerns were to be considered for paving. This program was to specifically address those unpaved roads that do not meet federal criteria for paving under the PM-10 (federal dust abatement) program. The Maricopa County Transportation Advisory Board (TAB) recommended to the Board of Supervisors that an annual allocation of 3 to 4 million dollars per year be set aside to in the MCDOT annual budget to pave selected LVR's.

GENERAL ROADWAY ANALYSIS

In addition to developing detailed maps and evaluation tables, a general analysis of the unpaved road system was also conducted. This included analysis of where the roads are located throughout Maricopa County. Many of these roads are located on Federal (such as BLM or Forest Service) or State lands. An environmental overview noted that due to the scattered nature of these roadways environmental concerns will vary for each segment. A few of these roads are in or near public parks and wilderness areas, and have multiple wash crossings. When recommending individual segments for paving, more detailed environmental reviews may be needed. The design criteria for paving these low volume unpaved roads provide guidance for right-of-way requirements and overall cost considerations.

COUNTY ROADWAY SYSTEM

In FY 2010 Maricopa County owned or maintained 2,353 miles of roadways. These roads are located in the unincorporated parts of the county, which includes both urban or near urban conditions as well as rural locations.

There are five different types of unpaved roads in Maricopa County. The first type is unpaved roads that are owned by the county and identified as open and declared. This

means the county owns right-of-way for these segments of road and has accepted the roadway into the County System. The second type are partially opened and declared roads. These are roads where part of the right-of-way is owned by the county. The third type are primitive roads. These roads are usually located in remote parts of the county and are accessing wilderness areas and are typically less developed than other areas. The fourth type are known as courtesy grade roads. These roads are existing unpaved roads with little or no county owned right-of-way, but maintained by MCDOT through historical precedent and allowed by state statute. The fifth type is unpaved roads not owned or maintained by the county. The table below provides a summary of these five roadway types and associated mileage of each.

Facts About County Unpaved Roads

- 803 miles of unpaved roads are within unincorporated Maricopa County.
- 166 of these miles are considered open and declared by the County.
- 218 of these miles are courtesy graded by the County.
- 7 of these miles are partially owned by the County.
- 360 of these miles are unpaved roads that are neither owned by the County nor courtesy graded by the county, but serve growing areas.
- 52 miles of these roads are primitive roads, accessing remote parts of the County.
- 597 road segments connect directly to a paved road.
- 230 miles of unpaved roads are inside the PM_{10} area and 573 miles of unpaved roads are outside the PM_{10} area.
- 164 miles of unpaved road segments are adjacent to or surrounded by an incorporated city or town boundary.

TRANSPORTATION ADVISORY BOARD EVALUATION CRITERIA

A comprehensive inventory of the unpaved roads system builds on the updated base map and centerline file created in 2008 by inserting evaluation criteria into the database for each unpaved road segment. The data for the evaluation criteria are important because it provides a descriptive picture of each unpaved road segment.

The criteria used by the TAB is listed below.

- The Board of Supervisor District the segment is located in.
- The length of the roadway segment (miles).
- Is the road segment located inside or outside the PM_{10} area?
- Is the road segment county maintained or not?
- The Major Streets and Routes Plan classification.
- The average daily traffic count.
- Does the road segment connect to an existing paved road?
- The percent of estimated right-of-way.
- Does the segment serve a public facility?
- Are there any safety concerns (high accident rate for instance)?

- The cost per mile to pave.
- The total project cost.

Additional Criteria

In addition to the TAB evaluation criteria, MCDOT staff collected data on the following information for each roadway segment:

- How many small washes cross the road segment?
- How many large washes or rivers cross the road segment?
- Are there any major utilities within close proximity?
- How many public facilities are in the vicinity of a given road segment.
- Crash data for a three year period
- The general land ownership where the road segment is located.
- The distance to the nearest paved road.
- What is the nearest or adjacent city?

LAND OWNERSHIP

Unpaved roadways in unincorporated Maricopa County are found in both urban and rural settings. Due to the growing municipal areas and annexation patterns, many pieces of unincorporated county lands are often immediately adjacent to or surrounded by cities. Analysis of the unpaved road segments revealed 235 miles of unpaved roads that are immediately adjacent to various cities and towns. In addition, there are 25 miles of unpaved roads within one mile of a jurisdiction. However, these unpaved roads are not likely to become urban in the future unless or until they are paved to a public standard.

Land ownership in Maricopa County falls into one of the following general categories: private, Bureau of Land Management (BLM), Military, National Forest, State Trust Lands, Indian Reservation, local or state parks, wilderness, and unidentified other lands. The table below shows a breakdown of land ownership type, estimated percentage of ownership within the county, and the number of miles of unpaved roads located in each type.

Land Ownership Type	Acres	%of Acres	Unpaved Mileage
Private	734,989	16.20%	546
BLM	1,606,205	35.40%	144
Military	655,332	14.44%	18

DESIGN CRITERIA

Typical roadway sections from the 2004 MCDOT Roadway Design Manual were initially used to guide the design criteria for paving a roadway. The information below provides a summary of the overall estimated ROW needs. Approximately 499 miles of unpaved roads do not have any ROW, 73 miles of unpaved roads have some percentage of required ROW, and 231 miles of unpaved roads have the entire ROW required.

Estimated Right-of-Way	Mileage
No ROW available	499
1% to 25%	7
26% to 50%	38
51% to 75%	14
76% to 99%	14
100% of needed ROW estimated	231
Total	**803**

Current street functional classifications for unpaved roads are Principal Arterial, Minor Arterial, Major Collector, Minor Collector, and Rural Local. The information below provides a summary of the unpaved road mileage of each classification. The current MCDOT Roadway Design Manual recommends standards for these roadway classifications.

Classification	Mileage
Principal Arterial	1.34
Minor Arterial	16.78
Major Collector	7.69
Minor Collector	77.13
Rural Local	701.56
Total	**803.00**

COST SHARE POLICY

MCDOT will always seek financial partnering for paving a dirt road from any jurisdiction or significant commercial traffic generators adjacent to or benefiting from the project. MCDOT can only pay for HURF related expenditures. Cost sharing will be consistent with the adopted MCDOT Cost Share Policy.

TABLE OF CONTENTS

List of Tables

List of Figures

List of Maps

INTRODUCTION

As of April 2011, Maricopa County maintains and inspects a total of 420 bridges and structure on public roads. By the Federal Highway Administration definition, 278 of these structures are qualified to be called “bridges” or “in-service” structures, meaning each of these has a length greater than 20 feet. The remaining 142 are called “off-system” structures, because their length is 20 feet or less.

DATA GATHERING AND ANALYSIS

“In-Service” and “Off-System” Structures

An “in-service” structure is described as one with an overall length greater than 20 feet, therefore qualifying the structure for federal aid, while bridge structures 20 feet or less in length are often called “off-system” or “non-federal aid” bridges. However, every structure within MCDOT’s jurisdiction is inspected in accordance to the Federal Highway Administration’s National Bridge Inspection Standards Recording and Coding Guide. This procedure allows MCDOT to maintain thorough, consistent records on each bridge and structure in the County system. The decision to maintain and inspect all of MCDOT’s structures enables MCDOT to include off-system structures when considering how to best appropriate funds and prioritize in-house projects. Due to the comprehensive data MCDOT maintains on all structures, MCDOT is readily able to evaluate its inventory as a whole, rather than being restricted to information gathered only on the in-service structures.

EVALUATION CRITERIA

In 1997 the Maricopa County Bridge Investment Study (BIS) recognized the need to evaluate bridges separately from roadway projects. The following information identifies MCDOT’s method of scoring and prioritizing bridge projects.

The following categories of bridge projects were chosen for evaluation and prioritization.

1. Replacement Projects
2. Replacement of Dip Sections with New Structures
3. Scour Protection Projects
4. New Bridge Projects (not included in major road projects)

REPLACEMENT OF EXISTING BRIDGES

During FY 2010-2011, MCDOT did not replace any existing bridge structure. A bridge should only be considered for replacement if all four of the following conditions are met:

1. The cost of rehabilitation is 55% or more than the cost of a new bridge.

2. The bridge is functionally obsolete.
3. The sufficiency rating is less than 50.
4. The Bridge Engineer agrees replacement is justifiable.

RECOMMENDATIONS FOR TIP PROGRAMMING PROCEDURES

Each year, MCDOT reviews the highest rated bridge projects from the following subcategories:

1. TIP Projects
2. Replacement of Existing Bridges
3. Replace Dip Sections with New Structures
4. New Bridge Projects (not included in major road projects)

In any given year, the budget allocation may not support inclusion of all top rated bridge projects in the Transportation Improvement Program. When this occurs, decisions are made based on the rating criteria and professional engineering judgment.

ASSET MANAGEMENT FOR BRIDGES

In 2002, MCDOT began an asset management program for its bridge inventory. To date, MCDOT's bridge and structure inventory asset valuation is estimated at $136,557,471.

SUMMARY OF THE 2010-2011 INSPECTION SEASON (8/1/10 to 6/30/11)

In the FY 2010-2011 inspection seasons, MCDOT's bridge inventory consisted of 278 in-service structures and 142 off-system structures. These numbers include eleven new structures that were added to the MCDOT inventory. Nine of these are in-service structures (concrete box culverts) and two are off-system structures (bridges)

This year seven structures were annexed or otherwise removed from MCDOT's bridge inventory. A complete summary of the activity for the 2010-2011 inspection season is included at the end of this report.

FEDERAL FUNDING ELIGIBILITY COMPARISONS

Structures Eligible for Federal Replacement Funds (SR < Than 50)

The Federal Highway Administration guidelines stipulate that when a bridge's sufficiency rating falls below a Sufficiency Rating (SR) of 50, the bridge becomes eligible for federal replacement funds. As of March 2010, Maricopa County has only one structure which has a rating below 50: the Gillespie Dam Bridge located on Old US 80 at the Gila River. This structure was originally constructed in 1927 and is on the National Register of Historic Places (NRHP). It is the only steel truss bridge in the

County.
Due to the value and importance in retaining and restoring this historical structure, the MCDOT Bridge Engineer initiated an in-depth inspection of the Old US 80 Bridge at the Gila River in 2005. The in-depth inspection report was completed in June 2007 and restoration items have been identified. Construction and rehabilitation plans were finalized in 2010 and work is anticipated to start in the Fall of 2011.

Structures Eligible for Federal Rehabilitation Funds (SR between 50 and 80)

The Federal Highway Administration guidelines stipulate that when an in-service structure's bridge's sufficiency rating falls between a score of 50 and 80, the bridge structure becomes eligible for federal rehabilitation funds. Currently, there are twenty-five structures in MCDOT's inventory that have sufficiency ratings between 50 and 80. Of these twenty-five, eighteen are in-services structures that would qualify for federal aid for rehabilitation.

After each inspection cycle the Bridge Engineer or his designee pays specific attention to all structures that had a significant change (ten points or more) in the sufficiency rating in order to determine what caused the change. Remedial action is taken as necessary. Table 1 lists the in-service structures in MCDOT's inventory that have sufficiency ratings between 50 and 80. Table 1A lists the in-service structures in MCDOT's inventory that have a sufficiency rating lower than 50. The tables also show the deficiency ratings.

POTENTIAL FEDERAL FUND PROJECTS VS. OVERALL MCDOT INVENTORY

In June 2010, the percentage of in-service structures in MCDOT's inventory that were eligible for federal funds was 6%. In July 2011, the percentage of these structures in our inventory was 4%. The vast majority of structures in Maricopa County are still in excellent condition.

NOTABLE 2010-2011 BRIDGE EVENTS

The Federal Highway Administration and all fifty states have established a goal that Load and Resistance Factor Design (LRFD) be the standard design code applied in all new bridge designs beginning in 2007. LRFD takes variability in the behavior of structural elements into account and relies extensively on the use of statistical methods to calculate design loads. MCDOT is in compliance with this goal and began using the LRFD code in new bridge designs in 2006.

8021	Gila River Bridge	Old US 80	Functional	46.5

The Gillespie Dam Bridge continues to be the only bridge currently listed in the National Register of Historic Places (NRHP). Bridge rehabilitation for this structure is programmed in the TIP in FY 2012-2016. Federal Aid will be used to finance the rehabilitation cost.

SYNOPSIS OF MCDOT'S BRIDGE PROJECTS

Bridge Projects in the MCDOT FY 2012-2016 TIP

Currently, MCDOT has seven bridge and structure projects in the TIP. These projects include bridge rehabilitation, replacement, and new bridge designs. Refer to Table 2 for a list of the projects.

Table 2. Bridge Projects in the MCDOT FY 2012 – 2016 TIP

STATUS	FEATURE	FACILITY/ FACILITIES	LOCATION	IMPROVEMENT
FY 2012 to 2016	Agua Fria Riv-er	Deer Valley Rd Bridge	El Mirage Rd to Lake Pleasant Rd	Prepare Final Design
FY 2012 to 2016	Gila River	Old US 80 Bridge	Gillespie Bridge	Bridge Rehabilitation Final Plans
FY 2012	Salt River	Gilbert Road Bridge	At Salt River	Bridge Replacement Final Design
FY 2011 to 2012	BID Canal	Miller Road Bridge	At BID Canal	Prepare Final Design
FY 2012 to 2016	Salt River	Dobson Road and McKellips Road Bridges	at Salt River	Design Concept Report for two new bridges
FY 2012 to 2016	Queen Creek Wash	Meridian Road Bridge	At Queen Creek Wash	Design Concept Report in Progress
FY 2012	Beardsley Canal	Indian School Road Box Culvert	At Beardsley Canal	Construction Plans being finalized

Status of Bridge/Structure Projects Completed in FY 2010 (July 1, 2010 – June 30, 2011)

Five bridge/structure projects (new structures, reports, or scour protection) were completed in FY 2011, as listed below in Table 3.

Table 3. Structure Projects Completed in FY 2011

New RCBs	Two new RCBs constructed on El Mirage Rd north of Bell Rd
RCB Extended	El Mirage Rd north of Bell Rd
New RCB	Deer Valley Access Rd west of El Mirage Rd
New RCB	El Mirage Rd south of Loop 303
Report	67th Avenue Box Culvert at the Salt River Scoping Study

Status of Bridge & Structure Projects Currently Under Construction

Presently, MCDOT has two new box culverts under construction and one existing box culvert is being widened and extended. In addition, there are several private development structures currently under construction. Table 4 lists the bridge projects currently under construction by MCDOT.

Table 4. Bridge Projects Under Construction by MCDOT

PROJECT LOCATION	Work Description
Ellsworth Rd Improvements	Two New Box Culverts and One Culvert Widening and Extension

Status of Bridge & Structure Projects Currently Being Designed

There are currently six bridge projects in various stages of design by MCDOT, as well as numerous structure projects within private developments in the design phase. Table 5 lists the bridge projects currently under design or in the Design Concept Report (DCR) process.

Table 5. Projects Currently in the Design Phase by MCDOT

NAME	FACILITY	STATUS
Indian School Road Box Culvert	Beardsley Canal	Construction Plans being finalized.
Deer Valley Road Bridge	Agua Fria River	Construction Plans in progress.
Dobson Road Bridge and McKellips Road Bridge	Salt River	DCR in progress.
Ellsworth Road Box Culverts	Sonoqui Wash East Branch and Sonoqui Wash	Construction completion in Spring 2011.
Miller Road Bridge Rehabilitation	BID Canal	Scoping Study completed. Construction Plans in progress.
Riggs Road Bridge	Sonoqui Wash	Construction Plans completed. Construction to begin Fall 2011.

Each year MCDOT must report to the Board of Supervisors concerning the physical condition of its bridges and structures as compared to the adopted criteria as required by the Governments Accounting Standards Board Statement 34. The latest ratings of the County's bridges and structures along with the bridge sufficiency ratings (BSR) are shown below.

Table 6. SUMMARY OF ACTIVITY FOR THE 2010–2011 BRIDGE INSPECTION

Criteria	Target Value	Actual Value
% of Bridges and Structures with BSR > 70	min. 90%	99.8%
% of Bridges & Structures with BSR < 50	max. 3%	0.24%

Summary of Structures for the 2010 - 2011 Inspection Season

Total number of structures in inventory: 420

Number of Federal Structures:	278
Number of Non-Federal Structures:	142
Number of bridges:	86
Number of culverts:	334

Total number of new structures added to database this year: 7

Total number of federal structures added to database this year: 5

Structure Number 11070 Gavilan Peak Parkway RCB (just N. of Jordan Lane)
Structure Number 11071 Deer Valley Road RCB (just N. of Existing Deer Valley Dr)
Structure Number 11105 El Mirage Rd RCB (1.7 miles N of Bell Rd)
Structure Number 11106 El Mirage Rd RCB (3.4 miles N of Bell Rd)
Structure Number 11111 Centennial Rd Bridge (5.7 miles W of Harquahala Valley Rd)

Total number of non-federal structures added to database this year: 2

Structure Number 990279 El Mirage Rd RCB (600' S. of Loop 303)
Structure Number 990280 116th St RCB at Consolidated Canal

Total number of structure replacements made this year: 0

Total number of structures removed/annexed from database this year: 7
Structure Number 7641 Bell Road Bridge at Beardsley canal - Annexed by Surprise
Structure Number 8858 Greenway Rd Bridge at Beardsley canal - Annexed by Surprise
Structure Number 10087 Germann Rd Bridge at Eastern canal - Annexed by Gilbert
Structure Number 8980 Meadowbrook Ave Bridge at Lateral 23 - Annexed by Phoenix
Structure Number 7553 Deer Valley Rd Bridge at wash - Annexed by Surprise
Structure Number 990173 Indian School Rd RCB at Lateral 23 - (not maintained by MCDOT)
Structure Number 990199 Thomas Rd RCB at Lateral 23 - (not maintained by MCDOT)

Introduction

Pavement maintenance is broadly identified as work accomplished to preserve or extend the pavement's life until major rehabilitation or complete reconstruction is performed. Maintenance is classified by function as either routine or preventive.

Preventive maintenance preserves rather than improve the capacity or strength of the pavement structure. In order for preventive maintenance to be effective, it should be applied to structurally sound pavement, before the pavement displays significant amount of environmental distress such as raveling, oxidation, and block cracking. Timely treatments prove to be the most cost effective. While, routine maintenance more typically consists of, pothole repair, patching, sweeping and/or striping.

All roads deteriorate over time due to environmental conditions and the volume and type of traffic using the roadway. The roadways within the jurisdiction of the Maricopa County Department of Transportation (MCDOT) are maintained at a high level of service by the following County program:

- Continuously monitor and evaluate roadway conditions, roadway evaluation ratings are stored in the Road Management System (RMS) database
- Report roadway conditions to decision makers via annual reports
- Modeling pavement conditions and maintenance strategies
- Develop annual and long term maintenance plans and implement the plans as funding permits

Roadway and Pavement Evaluation Ratings

Pavement Condition Ratings (PCR)

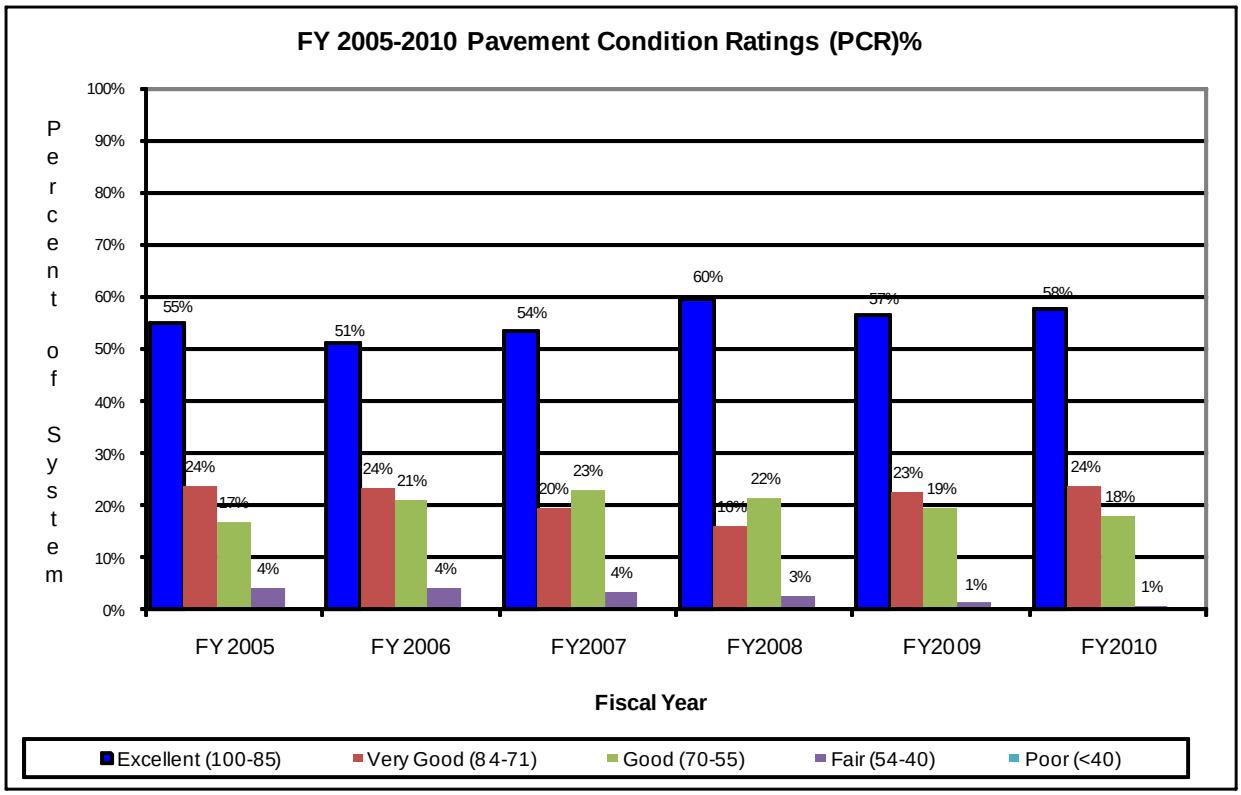
The Road Management Section evaluates pavement conditions for surface distress every 12-18 months for arterial roads and every other year for local roads. Half of the local roads are evaluated each year. The ratings range from 0 to 100 with 100 being a new pavement with no distress. The result allows for quantifying the overall pavement condition of the road network. See the Pavement Preservation Program (PPP) document for further details.

International Roughness Index (IRI)

MCDOT uses a Laser Road Profiler (LRP) equipped with triple (3) lasers, one in each wheel track and one in the mid-lane to collect IRI data. Annually the MCDOT Road Management Section collects the IRI for each arterial road segment with a length greater than a quarter of a mile. The IRI values are scored for each road segment on a scale from 1 to 500 with 500 representing an extremely rough road. IRI values are categorized by performance subgroups and the percentage of each group can be seen in Figure 2; IRI Ratings.

MCDOT utilizes the PCR and IRI ratings to forecast preventive maintenance programs and Transportation Improvement Program (TIP) planning. The consistent

Figure 1: FY 2005-2010 Pavement Condition Ratings



results of implementing preventive maintenance on MCDOT roads is evident in the following chart Figure 1: PCR Ratings, which shows the PCR quality by percentage ranking of all arterial roads in the County. The PCR data is also presented in Table 4 on page 12 of this report.

Sufficiency Ratings

The Road Management Section collects most of the details for each arterial road segment. The rating identifies how well each road segment compares to the MCDOT Roadway Design Manual (RDM) standards. Ratings for each category are combined per road segment and scored on a scale from 0 to 100, 100 representing a road in compliance with the RDM standards.

The sufficiency ratings of arterial roads are updated only after major improvements or reconstruction of the road. New construction, widening, or significant improvement to the safety issues such as, bottleneck, drainage, vertical and horizontal sight distance are required to impact the rating. Sufficiency Rating of the network is provided in Figure 3.

Figure 2: FY 2005-2010 International Roughness Index

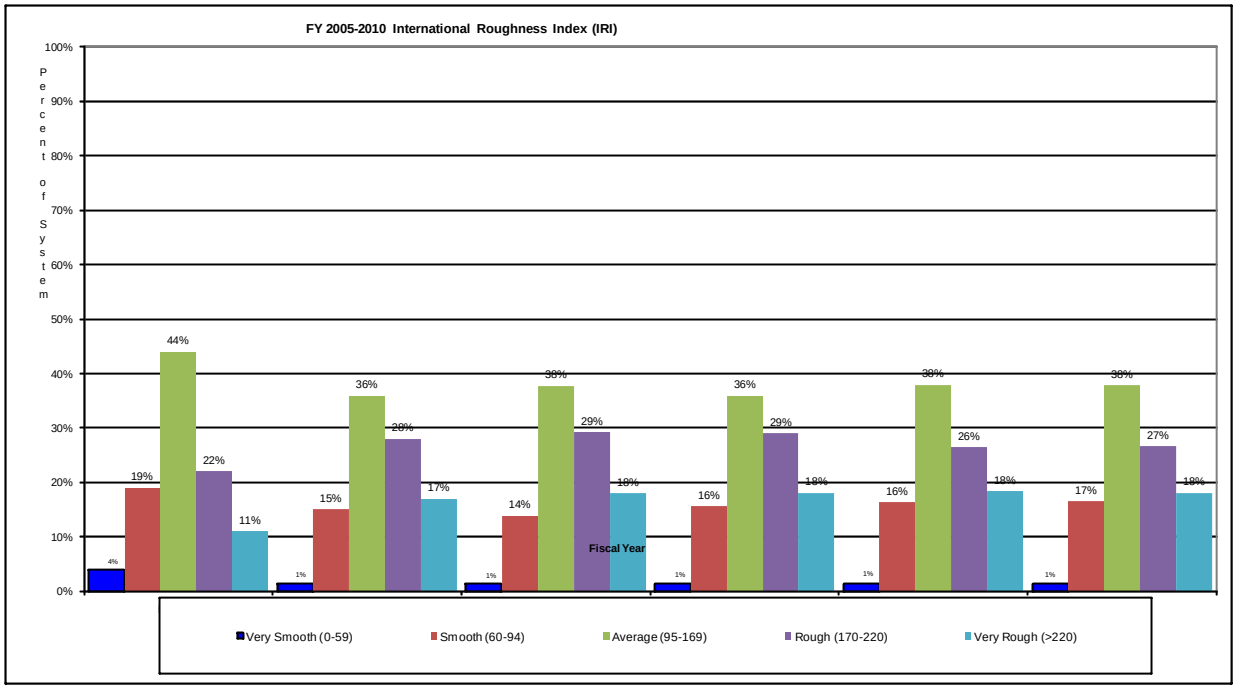


Figure 3. FY 2005-2010 Sufficiency Ratings

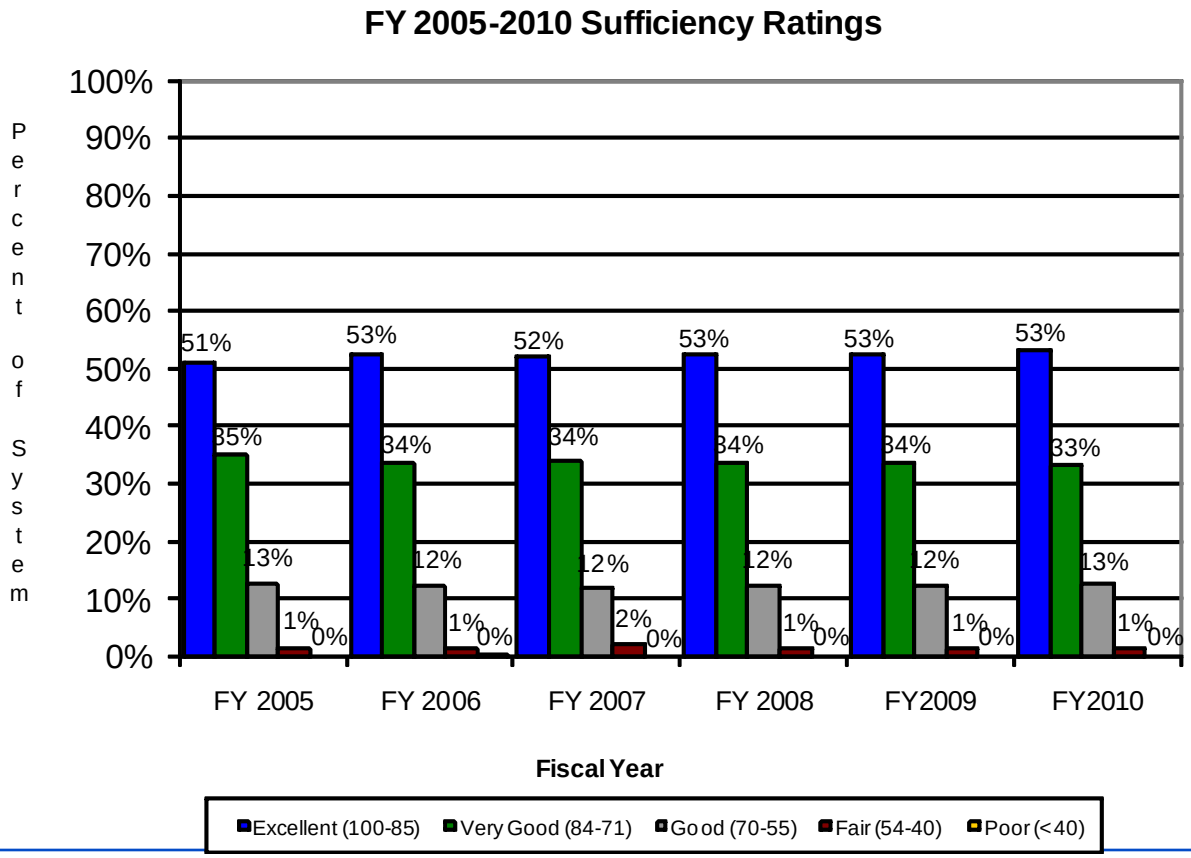

TRUCK TRAFFIC ON ARTERIALS AND COLLECTORS

Vehicle classification counts are conducted annually by MCDOT. The latest truck count data is shown in Figure 4. Truck traffic has declined 49% on MCDOT's arterial and collector roads since 2006. This is one indicator of the slow economy in the County. Individual yearly declines in the percent of truck traffic are shown in figure 5. The only positive aspect of this decline is that MCDOT's roadways will experience slower deterioration until the economy improves.

Figure 4: Average Percent of Trucks on Arterials & Collectors

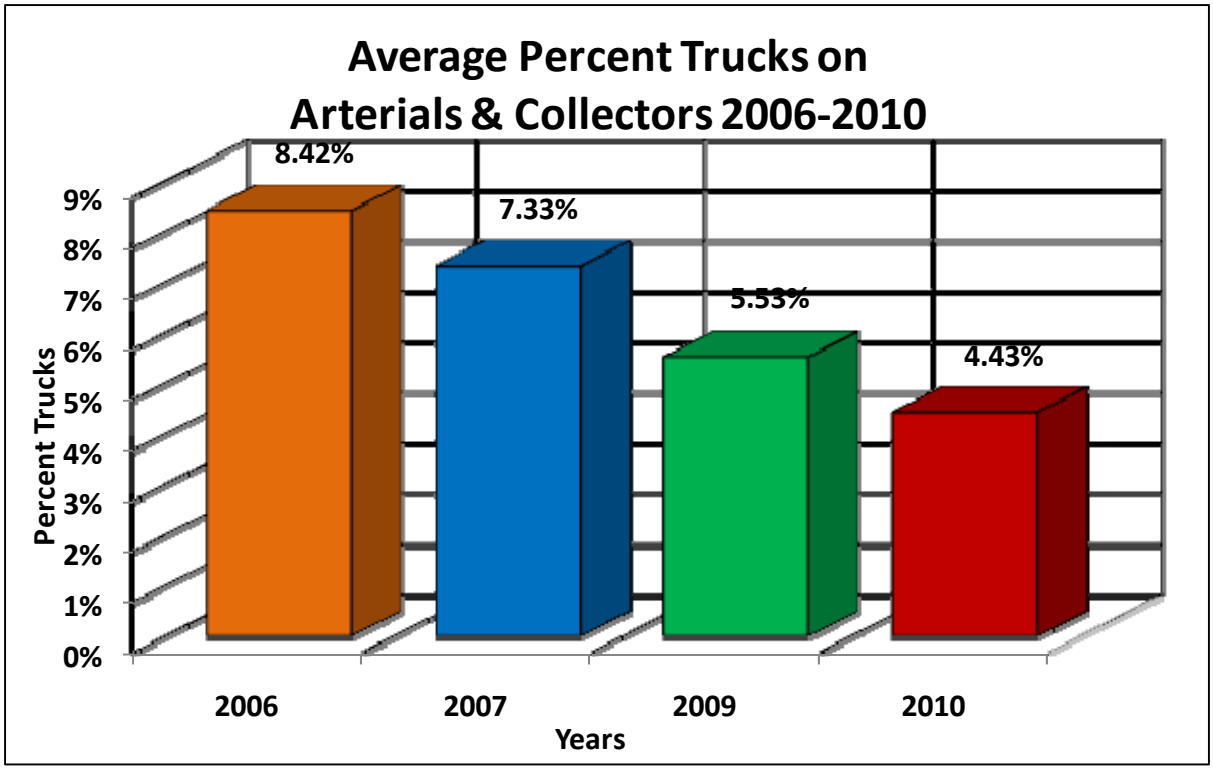

Figure 5: Yearly Percent of Trucks on Arterials & Collectors 2006-2010

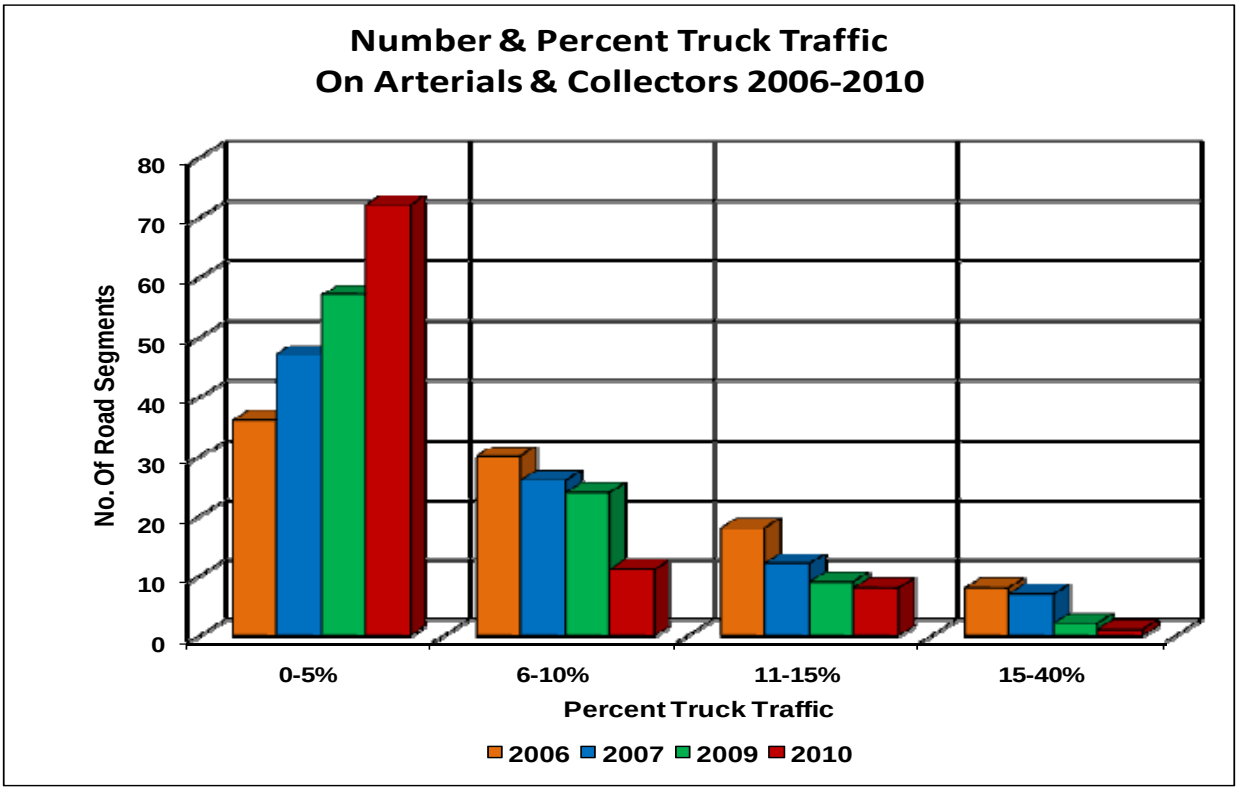

Preventive Maintenance Performance

Preventive maintenance extends the life of the pavement and provides for better performance. The majority of treatments for flexible pavements involves sealing the existing surface and providing a new wearing surface for traffic. Two of the primary factors leading to the deterioration and premature failure of flexible pavements are oxidization and water environmental damage.

MCDOT has used preventive maintenance practices for decades with excellent results. Table 1 shows the break down of each treatment that is typically used, the frequency of application and the observed increase in pavement life per application.
We can see how the maintenance of the road network could fall behind with only one tenth ($10 million) of the needed amount ($95 million) funded each year. The following table Figure 11 " FY 2007 Complete Maintenance Pans & Costs" provides us with a look at the aggressive maintenance utilized last year, the type of treatments, with the associated quantities and costs.

Table 1: Preventive Maintenance Treatment Longevity

Treatment	Pavement age at time of first application (yr.)	Frequency of application (yr.)	Observed increase in pavement life (yr.)
Fog Seal/ Rejuvenate	3 to 4	3 to 4	3 to 4
Crack Filling/Sealing	8 to 10	4 to 5	4 to 5
Single Chip Seal	10 to 12	5 to 6	5 to 6
Double Chip Seal	10 to 12	5 to 6	5 to 6
Micro Surfacing	10 to 12	5 to 6	5 to 6
Slurry Seal	10 to 12	5 to 6	5 to 6

Local—Mill & Resurface 1.5" ARHM	35+	TBD*	TBD*
* TBD—To be determined			

Preventive Maintenance Results

MCDOT currently has jurisdiction of 1112 miles (2613 lane miles.) of arterial roads, 884 miles (1856 lane miles) of local roads and 52 miles (104 lane miles) of park roads. That adds up to a total of 2048 miles of road and 4573 lane miles. In Fiscal Year 2010 we maintained 1257 lane miles of road which is equal to 27.5% of the total lane miles. The details of the completed maintenance plans are presented in Figure 4.

The cost to complete the 2010 maintenance plans was $22,327,505, while we spent $13,563,980 in 2009. The cost breakdown of all the maintenance completed is shown graphically in Figure 5. The same information is also presented in Table 2 on page 10 categorized by work order number.

These efforts resulted in network average PCR value of 82.6 for arterial roads versus 81.70 for 2009. Local roads improved the average PCR value of 91.9, versus 90.3 for 2009. Park roads rated 89.40 for 2010, park roads are a new breakout in 2010.

Pavement Preservation Plan

Pavement preservation plans are generated by application of the preservation strategy filters to the current pavement ratings in the database. Implementation of our projected maintenance plans for FY 2011 will cost $27.0 million to apply all the recommended surface treatments and existing pavement rehabilitation. While, the total network maintenance needs for the next five fiscal years (FY 2011 - 2015) are estimated at $70 million. The FY 2011 pavement preservation plans and estimated costs are provided in Figures 6 and 7.

The MCDOT maintenance funds will be enhanced in FY 2011 by the American Recovery and Reinvestment Act (ARRA) for $6.47 million and $2.5 million additional funds to be utilized in a

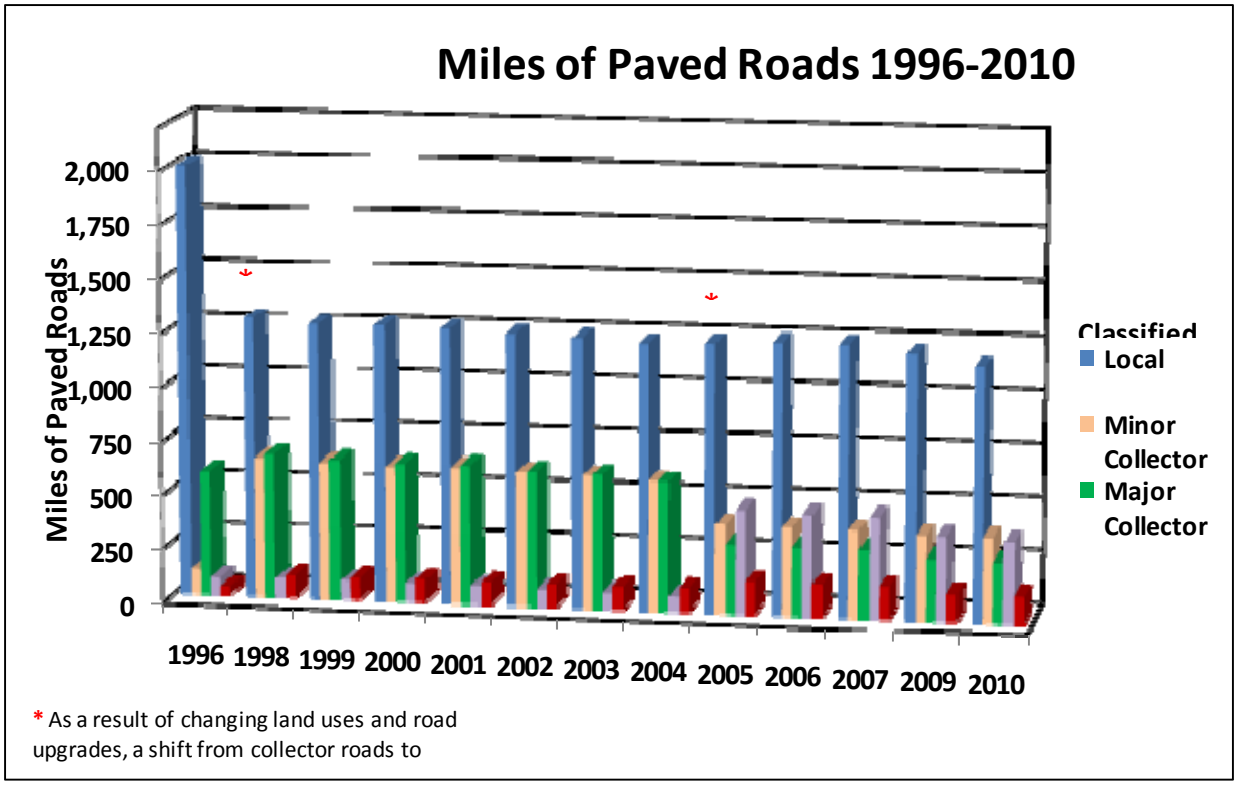
Note: As a result of changed land usages and road upgrades, a shift from collector roads to arterial roads occurred.

In 1997 and 2005 MCDOT roads were reclassified accordingly as seen in the above table.

Figure 8: Miles of Paved Roads 1996-2010



1.5” asphalt rubber overlay program. Furthermore, we are going to fund $5.30 million for a mill and resurface plan for Sun City West MRS 1. There will be $2.20 million of arterial AR overlays, $2.25 million for crack sealing, $2.5 million dollars for chip seal, $1.20 million for preservative seal and $0.88 million for slurry seal. There will be 13 programs in all executed this year. See Table 4: FY 2011 Pavement Preservation Plan for the details.

Summary

FY 2010 has been a very successful year for pavement preservation group and the Operations Division. We have completed 16 of 17 programs this year with an expenditure of $22,327,505 and only the 2010 ARRA AR Overlay being delayed due to federal requirements is still in progress.

All the effort this year has resulted in an improvement in the network average PCR value of 82.6 for arterial roads and PCR value of 91.9 for local roads. The results of the FY2010 pavement preservation program show the network is improving from 2009 85.56 PCR to 2010 86.80 and a 1.5% improvement. If additional funding becomes available we will consider accelerating our preventative maintenance plans for more crack seal, slurry seal, chip seal and mill and overlay projects to improve the quantity of MCDOT roads.

In 2008, it was projected that the pavement preservation and preventative maintenance needs for the five- year period of FY 2009 to 2013 would be $57.9 million to keep the county roadway system at the then existing serviceability level. In the past two fiscal years, FY2009 and 2010, MCDOT has completed pavement preservation and preventative maintenance projects for a total amount of $36.4 million, or 63 percent of the projection. Furthermore, due to the dynamic nature of the roadway system, in FY 2010 the projected needs for pavement preservation and preventative maintenance were identified to be $72.5 million for the next cycle of five fiscal years, FY2011 to 2015. See Table 2: Pavement Preservation 5 Year Summary Report for details.

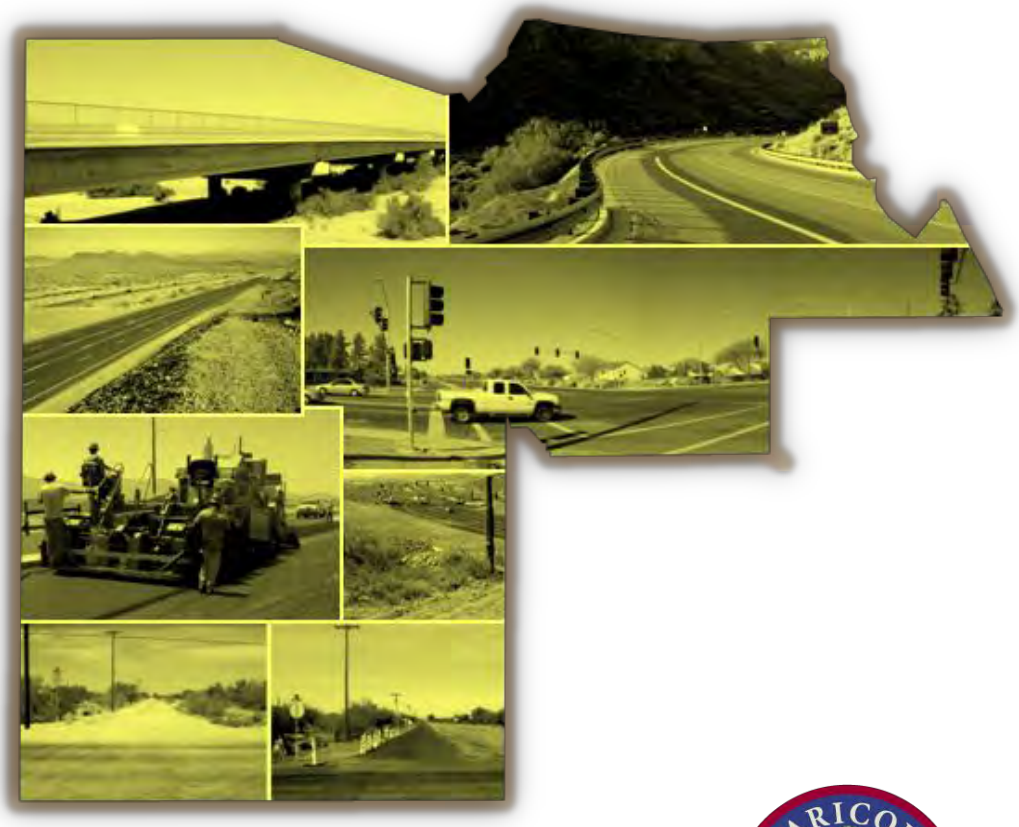
Asset Management System

Fiscal Year 2011



Programming & System Analysis

www.maricopa.gov

TABLE OF CONTENTS

List of Figures

INTRODUCTION

The Maricopa County and the Department of Transportation (MCDOT) maintains effective internal controls to manage its infrastructure assets, and to maintain proper records regarding the use and disposition of these assets. This is done to safeguard and maintain MCDOT's assets in order to receive the maximum benefit from these assets and to comply with State and Federal requirements regarding their use and disposition. MCDOT properly accounts each year for its infrastructure assets for financial reporting purposes in accordance with the Governments Accounting Standards Board (GASB) Statement 34.

MCDOT provides transparency as to how services are provided within the organization and to the County's constituents. It is the intent of the MCDOT Planning Division and Asset Management Team to educate, inform, develop and streamline Asset Management Reporting throughout MCDOT.

Background

Maricopa County adopted the GASB (Governmental Accounting Standards Board) Statement 34, titled *Financial Statements and Management's Discussion and Analysis for State and Local Governments*, model. This was done in June 15, 2001 order to be in compliance with GAAP (Generally Accepted Accounting Principles).

GASB has established GAAP for both state and local governments. GAAP sets the criteria that government must follow in order to obtain a "clean opinion" from auditors. A clean opinion means that an agency has good credit. This is very important when a government agency wants to issue bonds, obtain financing for long-term construction projects, and performance bonds. GASB approved its Statement 34 in June 1999. It was the first time government entities were requested to report the value of their infrastructure assets and develop methods and procedures for asset management similar to private businesses. The goal of GASB 34 is to have financial statements reflect the actual financial health of all government entities. Governments that do not comply with GAAP may pay more to issue debt because the bonding rating agencies will not be able to determine the actual financial health of the entity.

Maricopa County is still refining its asset infrastructure reporting procedures, internal controls, and how it assesses its non-TIP related assets. This is in response to three consecutive "adverse opinions" from the State Auditor General's Office, which identified these three areas of concern.

Real Estate

The Real Estate Division is responsible for property management and acquisitions, on behalf of Public Works. All land rights activity is validated by resolutions, deeds, or

Board of Supervisors Approvals.

The primary function of the Real Estate Division concerns the acquisition of right of way for capital projects in the MCDOT TIP and the Flood Control District (FCD) CIP. The Real Estate Divisions also tracks and/or processes municipal annexations, road declarations, road abandonments and excess land sales. Real Estate also maintains the records and documentation of these activities. The Board of Supervisors authorizes MCDOT and FCD projects by adoption of resolutions authorizing the departments to spend money to acquire right-of-way and construct and maintain projects, thus adding value to the respective asset management inventory

In FY 2010 Maricopa County added $48.2 Million in Land assets to its infrastructure inventory. The predominate means of adding to County assets has been the acceptance of subdivision plats and their associated infrastructure. The acceptance of subdivisions into the MCDOT system results in 95% of additional land added to MCDOT's inventory. Annexations by county municipalities is the primary means of land asset reductions to the MCDOT Inventory.

Traffic Signals

Traffic signals are typically part of a TIP project or acquired via the acceptance and opening and declaring a subdivision or other development. When part of a TIP project,

Figure 1: Assets Acquired by MCDOT in FY 2010

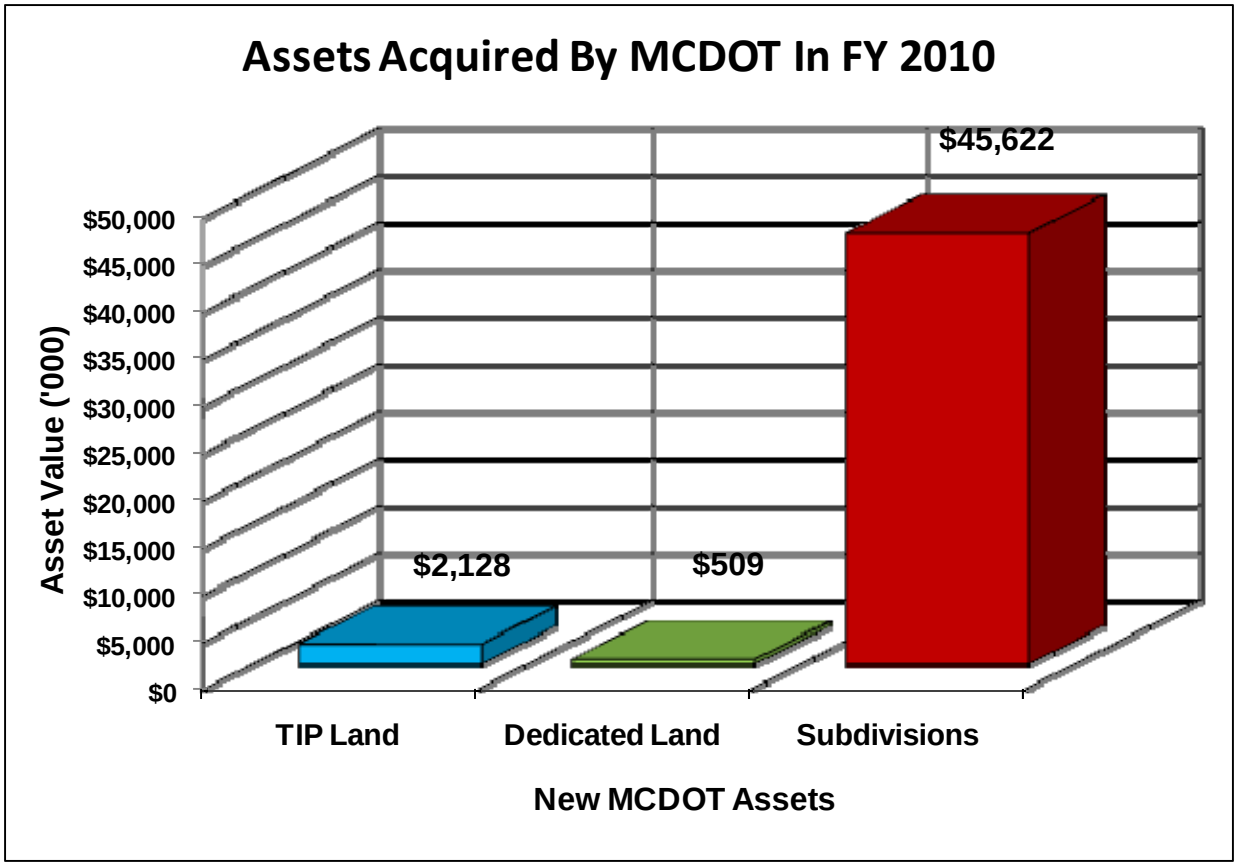


Figure 2: Asset Reductions in FY 2010

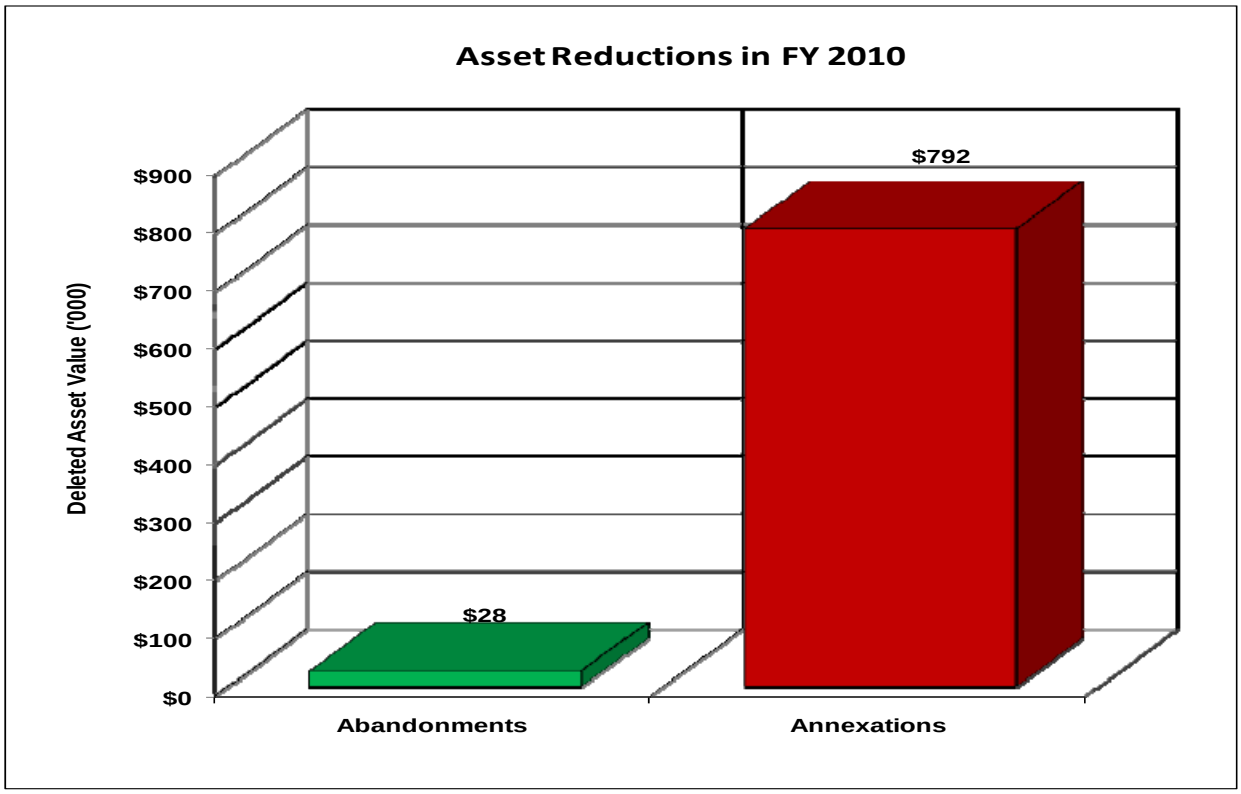

signals are added into the MCDOT inventory on the date the signal is switched on. MCDOT issues a letter of completion when a signal is turned on. The Board of Supervisors then approves the acceptance of the signal into the MCDOT inventory. Signals are deleted from the MCDOT inventory when they are annexed by an incorporated jurisdiction.

Bridges & Structures

The MCDOT Engineering Division is responsible for the design and inspection of all bridges and structures under County ownership. State and Federal Mandates require MCDOT to track and inspect its approximately 427 bridges and structures.

Structures acquired via the Board of Supervisors open and declare (O&D) process are typically from the acquisition of subdivisions or by MCDOT constructing the bridge or structure. The value of each bridge or structure is determined by the current MCDOT unit cost calculation (updated every 2 years).

Planning

The MCDOT Planning Division annually collects information on new and deleted MCDOT assets from each of the MCDOT divisions. Each identified new asset is assigned a dollar value and reported in the Consolidated Annual Financial Report (CAFR). Assets that are removed from the MCDOT inventory are also reported in the

CAFR as dollar deletions. The MCDOT Planning Division provides the Maricopa County Department of Finance a copy of the infrastructure inventory each year with the updated additions and deletions. This information is audited annually by the State Auditor General's Office.

Development Services

The MCDOT Development Services section issues construction permits and provides oversight of roadway and structure construction conducted by governmental agencies and private developers. The Development Services Section insures that contractors have a valid construction permit and conform to the Uniform Standard Specification for Public Works Construction published by MCDOT.

The permit records kept by Development Services provide the detailed paper trail necessary for documenting all new assets built in the unincorporated county and either donated to or acquired by MCDOT.

Transportation Improvement Program (TIP)

The Transportation Improvement Program is a collaborative effort between all the MCDOT divisions. The TIP projects are identified, budgeted, and timelines are created for major construction projects. Projects are added to the TIP based on scoping studies, engineering judgment, project schedules, or budgets are initially presented to an internal MCDOT committee and then to the Transportation Advisory Board for recommendations to the Board of Supervisors.

Projects can include transportation studies, improvements to structures, new traffic signals, low volume road paving, ant the new or reconstruction of roadways. Not all of the projects result in an addition to MCDOT infrastructure inventory. Non-capital projects such as planning studies and feasibility studies are expensed rather than being included as a physical asset. Other projects may be jointly funded through intergovernmental agreements where MCDOT shares the project costs and another municipality retains jurisdiction over the completed project.

Once a project is completed, MCDOT prepares correspondence to the contractor and MCDOT internal customers officially ending the project. Only when a project is completed and inspected is the asset accepted into the MCDOT asset inventory.

RECOMMENDATIONS FOR IMPROVEMENT

Data Integration and Agency Collaboration

Many challenges have been identified from MCDOT's recent audit findings. MCDOT is making significant efforts to improve the accuracy of its asset management reporting in response the findings of the State Auditor General. In order to develop an effective Asset Management System, enhanced collaboration is needed between all MCDOT Divisions and the County Department of Finance.

Data Integration:

The Maricopa County Department of Transportation has experienced three adverse opinions by the State Auditor General's Office concerning our asset management practices. These opinions are primarily based on the lack of adequate internal controls with respect to accounting for MCDOt's assets. Increased data Integration between all MCDOT divisions would allow MCDOT the capacity to establish necessary controls and monitor progress.

The annual MCDOT asset data collected needs to become more "Business Intelligent." A systematic approach to data collection must be addressed by each division with fixed timelines. This should involve all MCDOT divisions and result in each adopting common procedures and coordinating their recordkeeping and data collection efforts more effectively.

Each MCDOT division typically supports their own unique databases. These are effective in satisfying their personal and customer needs bur are much less effective in sustaining an Asset Management System. These individual databases are sometimes large and somewhat disjointed from the collective needs of MCDOT's asset reporting requirements. A proposed Asset Management Team could coordinate and implement a common data field system within each database that would allow linkages between all other division databases.

To this end, the MCDOT Infrastructure Technology Center (ITC), has taken the first step in developing a "Business Intelligence" tool to capture MCDOTS Assets. The MCDOT RoadRunner database is now the repository for most of the infrastructure data. Improving the RoadRunner Database to accept each division's data automatically should be a top priority at MCDOT.

MCDOT Management has to lead the efforts to change the corporate environment relating to asset management. Upper management involvement will help to break down the division barriers and encourage success of a project of this magnitude. The ultimate success of a comprehensive data integration process depends on the encouragement and cooperation of all the decision makers within MCDOT.

Benefits

The benefits of creating an integrated asset management system are numerous. The U.S. Department of Transportation, Federal Highway Administration, Office of Asset Management lists the following as benefits of Data Integration:

Availability/Accessibility –	Data is easily retrieved, viewed, queried, and analyzed by anyone in the agency in a more user friendly form.
Timeliness -	Data can quickly update and therefore are generally current. Normally in combined or linked databases only one update is necessary. In addition, databases are time stamped to keep track of when they were created, modified, or updated.
Accuracy Correctness - and Integrity	Data are commonly free of errors because the integrity of the databases is upheld in an integrated environment. Likewise, processes exist for automatic or convenient error checking and verification to help maintain the quality of the data during data entry and access.
Consistency and Clarity -	Specified data have a clear and unique definition throughout the agency, thereby avoiding or eliminating confusing and conflicting meaning and usage of data.
Completeness-	All available information associated with the assets, including historical and recently collected data can be found in the database. In addition, missing records or data fields are easily identified and flagged by the data management process.
Reduce Duplication -	Identical Data are not stored in multiple, disparate locations. Integration reduces the need for multiple updating and ensures that everyone has access to the same data.
Faster Processing - and Turnaround Time	Less time is spent on consolidating and transmitting data to various users in the agency. The integration data environment also supports faster data manipulation, allowing multiple users to conduct separate analysis concurrently.
Lower Data Acquisition- and Storage Cost	Data are not collected and processed twice, and are consolidated and stored at locations in the agency that provide optimal convenience and ease of maintenance.
Informed and - Defensible Decisions	Highly organized, comprehensive databases allow users to drill down through successive levels of detail for any given asset. This depth provides more information to support recommendations and allow users to conduct different types of analysis using various subsets or combinations of data.
Integrated Decision Making-	One of the greatest benefits of data integration is that it permits decision-support analysis throughout the transportation system, from the field to the executive level (vertically) and across divisions within and outside the organization (horizontally).
