Tucson, Arizona 85701-1207

June 1, 1992

Appendix A

Scope-of-Work for this Study

SOUTH BRANCH, UPPER CARMACK SUB-BASIN MANAGEMENT STUDY
SCOPE OF WORK

PHASE I: EXISTING CONDITIONS ANALYSIS

Task 1: Meet with representatives from Pima County's Flood Control District and Oro Valley to discuss the goals and objectives of the project.

Task 2: Collect and/or review all information that is currently available on the study area including:

- a. Existing zoning maps, land-use (area) plans, and other planning documents for Pima County and Oro Valley. This information will be used to establish the type and relative density of existing and future land uses at various locations within and adjacent to the study area.
- b. Soil Conservation Service, soil survey maps. These maps will be used to obtain the appropriate hydrologic soil groups associated with the South Branch watershed.
- c. Pima County's and Oro Valley's drainage complaint files. Information contained in these files will help to identify problem areas as noted by area residents.
- d. Pima County and the Arizona Department of Transportation drainage reports and improvement plans for the various residential subdivisions, commercial developments, and street-improvement projects that either exist or are proposed within the study area. These maps will help identify the location, type and size of any existing and/or proposed drainage structures.
- e. FEMA's Flood Insurance Rate Maps, Floodway Maps, and hydrologic calculations for the Carmack Wash and the South Branch, if available. This information can be used to substantiate the results obtained from both the hydrologic and hydraulic analyses.
- f. Historic and current aerial photographs and topographic maps. This information can be used to document changes in land-use and channel and watershed characteristics.

Task 3: Conduct a field investigation of the study area. The purpose of this investigation is to:

- a. Examine and document the physical characteristics of the watershed and stream channels to get a general feel for (1) the type and density of vegetation within the natural and landscaped subareas of the watershed; and (2) the type and roughness elements that make up the various segments of the watercourses.

- b. Clarify information shown on the newly-generated topographic maps that are to be provided (at a scale of 1" = 200' with two-foot contour intervals) by Pima County.
- c. Obtain or confirm the measurements of hydraulic structures that may regulate the magnitude and/or extent of flooding.
- d. Identify potential problem areas and make a preliminary assessment of the nature of the problem (i.e., a nuisance drainage problem versus a significant flood/erosion hazard).
- e. Note any significant physical characteristics along the watercourses that might, over time, affect the extent of flooding that will be determined as part of this study.

Task 4: Select appropriate runoff concentration points within the study area; then meet with Pima County's Project Manager for confirmation. Make any adjustments that may be necessary. This meeting will also include a discussion of the results of Tasks 2 and 3.

Task 5: Determine the full range of peak discharges at the selected concentration points using the Pima County Method. Recurrence intervals included will be the 2-year, 5-year, 10-year, 25-year, 50-year, and 100-year discharge events. Provide copies of the hydrologic computation sheets for Pima County's review and approval.

Task 6: Determine the extent of the 5-year, 25-year, and 100-year floodprone areas along all watercourses where the 5-year peak discharge exceeds 100 cfs. Floodplains will be delineated using a combination of the U.S. Army Corps of Engineers' water-surface model, HEC-2, and the Federal Highway Administration's culvert analysis program, HY8. Since the HEC-2 program is rigid-boundary model, an attempt will be made, from a qualitative standpoint, to define any changes in the extent of flooding that may occur as a result of channel/bank erosion, migration and/or avulsion.

Task 7: Identify the number and type of residential, commercial and public improvements that are affected by or fall within the delineated and/or anticipated floodprone areas; then meet with Pima County's Project Manager to discuss the results of this task and Task 6.

Task 8: Conduct a field survey to determine the finished-floor elevations of all affected structures and contact the occupants and/or owners in an effort to establish a history of drainage and/or flooding problems. Residents may be contacted in person or by mail if the number of affected structures prohibits personal interviews. In addition, utility companies and roadway maintenance personnel will be contacted to determine any drainage problems they may have encountered and the costs incurred in repairing and/or maintaining their respective problem areas. This information will be useful when damage assessments are made as part of the economic analysis.

Task 9: Using the information gathered under Task 8 and information provided by the Tax Assessor's Office, estimate the cost of potential flood damages that may result during the 5-year, 25-year, 100-year events. These estimates will be broken down to include residential and commercial properties, existing roadways and/or drainage improvements, and other relevant public or private improvements. In addition, this task will also attempt to identify any potential life-threatening situations that may be attributable to the three recurrence intervals.

Task 10: Based on the combined results of Tasks 1 through 6, develop, at a concept level, several site-specific and/or regional flood-mitigation measures that can be used to address the area's drainage problems and/or hazards. These measures will be developed in a manner that takes into consideration their known cost effectiveness and general acceptability by affected parties in similar areas. Emphasis will be given to the current philosophy of the Oro Valley community and their Pima County neighbors.

Task 11: Meet with Pima County's Project Manager to discuss the appropriateness of each mitigation measure and its application to a particular problem area. The need to proceed with Phase II of the study will also be discussed at this meeting.

Task 12: Prepare a report that documents the procedures and results of the Phase I study. The need to either proceed or not proceed with the Phase II study will also be discussed. In addition, this report will include:

- a. A composite drainage basin map that documents the various elements used in the hydrologic calculations (i.e., concentration points, soil types, zoning classifications and/or land-uses, and basin roughness characteristics);
- b. A floodplain map showing cross-section locations, floodplain limits, water-surface elevations, and affected structures and/or improvements. If necessary, to avoid clutter, more than one map will be prepared.
- c. Hard copies and magnetic media files (on 5 1/4 floppy disks) of the input/output listings from all computer models.

A draft copy of this report will be provided for review and comment before it is finalized. An appropriate number of copies will then be delivered to Pima County's Project Manager.

PHASE II: EVALUATION OF ALTERNATIVE MITIGATION MEASURES

Task 1: Meet with Pima County's Project Manager to determine which problem areas warrant a detailed evaluation and finalize the list of mitigation measures that will be evaluated in detail for each selected problem area.

Task 2: Develop preliminary designs for each of the selected mitigation measures and perform the appropriate analyses (hydrologic and/or hydraulic) to determine if the measure has a beneficial or a negative impact.

Task 3: Meet with Pima County's Project Manager to discuss the results of Task 2 and to establish an acceptable tolerance range for those mitigation measures that demonstrate a negative impact. Any measure that is not within the acceptable tolerance range will no longer be considered a viable alternative. Consequently, it will not be included in the preliminary cost analysis.

Task 4: Develop preliminary cost estimates of all viable alternatives including engineering, construction, right-of-way, land acquisition, and any other applicable costs. Evaluate the cost-effectiveness of each alternative for each problem area. Compare the most cost-effective alternative to the benefit derived by its implementation.

Task 5: Meet with Pima County's Project Manager to discuss the results of Task 4 and make adjustments accordingly.

Task 6: Prepare a composite report that documents the procedures and results of both phases of the study. This report will include all elements of the Phase I report. The Phase II discussion will include recommendations which address the urgency of implementation of those alternatives that were determined to be the most cost-effective for a particular problem area. A draft copy will be provided for review and comment before the report is finalized. At a minimum, ten copies of the final report will be delivered to Pima County's Project Manager with a reproducible version of the text and all exhibits.

Appendix B

Hydrologic Data Sheets for the 100-year Return Interval (individual data sheets for the more frequent return intervals are also provided in a compressed format on an accompanying 5 1/4" double-density diskette)
