

HYDROLOGIC DATA REPORT
VOLUME II - SURFACE WATER AND STREAMFLOW DATA
WATER YEAR 2014

*Sauceda Wash, ID# 6923
(photo date: August 13, 2014)*

PREFACE

This publication presents the surface water data collected by the Flood Control District of Maricopa County's automated water-level gage network. This telemetered network is located primarily throughout Maricopa County, Arizona with additional gages in Yavapai, Pinal, and La Paz Counties.

The surface water data contained in this report were collected, compiled and edited by the Flood Warning Branch of the Engineering Division. Data include mean daily, total, maximum, and minimum discharges at the flow sites; mean daily, maximum, and minimum pool levels at the storage locations; and mean daily, maximum, and minimum volumes stored at the storage locations. Also included are maximum discharges, pool levels, and storage volumes for flood events of interest at each site. Additionally, following the annual data is one or two graphics representing the runoff / impoundment history for the station and, when available, a graphic of the flood flow frequency with annual maximums. Flood flow frequency graphics are provided for informational purposes only and should not be used for regulatory purposes, unless the information is provided by a regulatory agency such as FEMA.

The information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, notes have been included to identify questionable data. Reliance upon the accuracy, reliability, and authority of this information is solely the responsibility of the user.

Revisions to any of these data for any reason will be published in the following years' reports immediately following the data for the current year for the site where the revisions have been made.

Copies of this report may be purchased from:

Surface Water Streamflow and Storage Facility Discharge Data	Part 1
Pool Levels at Storage Facilities (Reservoir Depths)	Part 2
Storage Volumes at Storage Facilities	Part 3

INTRODUCTION

The Flood Control District of Maricopa County in cooperation with federal, state, and local agencies collects a large amount of data pertaining to surface water runoff in and around Maricopa County. These data provide a valuable resource for information not otherwise furnished by the traditional sources of this type of material. To make these data readily available to interested parties outside the Flood Control District, the data are published annually in this report entitled "Annual Hydrologic Data Report, Volume II -- Surface Water and Streamflow Data." On-line users of this document have additional resources available by selecting hyperlinks. Gage names will link to the web page for that streamgage. Other hyperlinks will link within the document.

This report includes records on discharge at stream gages and at flood control storage structures, on depths at flood control storage structures, and on contents at flood control storage structures. Specifically it contains: (1) Streamflow records at 124 stream gages and 53 flood control storage structures; (2) Pool levels of stored water at 53 flood control storage structures; and (3) Storage volumes at 53 flood control storage structures where stage-storage relationships are available.

Several streamflow gages are operated cooperatively between the FCDMC and the United States Geological Survey (USGS). Although real-time data for these sites are collected by the FCDMC ALERT System for the purposes of flood event monitoring, quality control for the data at these gages lies with the USGS. The official records for these sites are published in the USGS Surface Water Data Reports each water year or for current data go to <http://az.water.usgs.gov/>. The cooperative gages collected jointly for Water Year 2014 were:

<u>USGS Gage Name</u>	<u>FCDMC ID</u>	<u>USGS ID</u>
Gila River near Maricopa, AZ ^{*(1)}	0788	09479350
Salt River at Priest Drive ⁽¹⁾	4523	09512165
Cave Creek below Cottonwood Cr. ⁽¹⁾	4923	09512280
Skunk Creek near Phoenix, AZ ^{(1), (2)}	5568	09513860
Gila River at Estrella Parkway ^{(1), (2)}	6853	09514100
Hassayampa River near Morristown ⁽¹⁾	5223	09516500
Centennial Wash at SPRR ^{(1), (2)}	5103	09517490

*Gage is a cooperative between USACOE and USGS.

⁽¹⁾ Located at or near a FCDMC ALERT water-level gage.

⁽²⁾ Continuous Slope Area location

There are three additional continuous cooperative gages which the USGS operates, but are not ALERT equipped.

<u>Gage Site Name</u>	<u>USGS ID Number</u>
Indian Bend Wash at Curry Road, Tempe	09512162
New River near Rock Springs ⁽²⁾	09513780
Hassayampa River near Arlington	09517000

In addition to the continuous cooperative stations, the FCDMC also cooperates with the USGS in the collection of peak discharges at a number of crest-stage gage sites. The data for these crest-stage gage sites are also published by the USGS in its Surface Water Data Reports each water year.

The cooperative crest-stage gage sites for Water Year 2014 were:

<u>Gage Site Name</u>	<u>USGS ID</u>
Vekol Wash near Stanfield, AZ ^{(1), (2)}	09488650
Tortilla Creek at Tortilla Flat	09501300
Camp Creek near Sunflower	09510170
Rock Creek near Sunflower	09510180
Indian Bend Wash at Shea Blvd ^{(1), (2)}	09512090
Salt River Tributary in South Mountain Park	09512200
Agua Fria River Tributary No. 2 ⁽²⁾	09512700
Deadman Wash near New River	09513820
Waterman Wash near Buckeye	09514200
Hartman Wash near Wickenburg ⁽¹⁾	09515800
Ox Wash near Morristown	09516600
Jackrabbit Wash near Tonopah	09516800
Centennial Wash Tributary near Wenden	09517200
Tiger Wash near Aguila ^{(1), (2)}	09517280
Winters Wash near Tonopah	09517400
Rainbow Wash Tributary near Buckeye	09519600
Bender Wash near Gila Bend ⁽¹⁾	09519750
Sauceda Wash near Gila Bend ⁽¹⁾	09519760
Military Wash near Sentinel	09520100
Crater Range Wash near Ajo	09520230
Star Wash	09516790
Delaney Wash ^{(1), (2)}	Not Assigned

⁽¹⁾ Located at or near a FCDMC ALERT water-level gage.

⁽²⁾ Continuous Slope Area location

Furthermore, the USGS and FCDMC operate several Continuous Slope Area gaging locations at several of the above stations.

ALERT water-level sensors are located on two Corps of Engineers structures. Tat Momolikot and Whitlow Ranch Dams are monitored by the Corps of Engineers. Again, these data are collected in real-time by the FCDMC for the purpose of flood monitoring. The District will publish data for Tat Momolikot

Dam since data are no longer collected by the Corps. Please refer to the Los Angeles District office for official data for Whitlow Ranch Dam at <http://www.spl.usace.army.mil/Missions/CivilWorks/ReservoirRegulation.aspx>.

This is the 21st annual surface water report published by the District. Prior to water year 1994, surface water data collected by the FCDMC ALERT System were not quality controlled, and therefore, not published. However, there are data resident in archives prior to water year 1994 that may have value to specific individuals. Data are available back to October 1987 for some stations.

The data are collected as a depth of flow in feet (or stage). The discharge and/or contents is then obtained by applying the stage to a rating curve of stage versus discharge in cubic feet per second (cfs), or stage versus contents in acre-feet (ac-ft). The discharge rating curves have been developed at stream gages by using field surveyed cross sections in a HEC-2 or HECRAS step-backwater computer model to obtain a range of stage versus discharge points to be plotted on a curve. These step-backwater ratings are refined whenever possible using direct and/or indirect measurements made at or near the gage site. For flood control storage structures, discharge ratings were obtained in one of two ways. First, the design ratings may be used. In most cases however, the discharge rating curves were developed by application of the Federal Highway Administration's HY-8 computer model for culvert flow and U.S. Geological Survey methods for weir flow over the uncontrolled emergency spillways. The storage rating curves were obtained from published as-built or construction plans or developed from digital elevation data.

Daily mean discharges are computed by applying the daily mean stages (gage heights) to the stage-discharge curves or tables. A similar computation is done for storage facility contents. The minimum and maximum values are based on instantaneous readings and the volumes for discharge stations are based on accumulations of daily means. Those gages in section 2, Pool Levels at Storage Facilities, which show a continuous gage height during obvious periods of no storage, do so because the orifice of the pressure transducer is set at that gage height above or below 0.0 feet gage datum.

All data in this report have been reviewed and edited in an attempt to provide the most accurate data possible. A blank or blanks, represented with ---, within the data set is an indication that data were lost either due to hardware, software, or radio problems, or that the gage had not yet been installed. Where possible, these data are flagged with footnotes describing the time the gage was down. In the event that published records require revision, revisions are printed in later reports. Listed in the heading for each gage where records have been revised are all the reports in which revisions have been published for the station and the water years to which the revisions apply (e.g. WY1999: WY1994-95 means that the data for Water Years 1994-1995 were revised in the report for Water Year 1999).

Comments about this report or errors discovered may be sent to the Flood Warning Branch via Internet e-mail from the FCDMC ALERT System Home Page or directly to David Gardner at deg@mail.maricopa.gov.

An index of gage names, numbers, locations, and other descriptors is included following the Definition of Terms in this report.

Additional, more detailed, or historical surface water data are available on the FCD ALERT Internet site at <http://www.fcd.maricopa.gov/Rainfall/Streamflow/streamflow.aspx>.

For information about the Internet site, contact the Flood Control District, Engineering Division, Flood Warning and Data Collection Branch at (602) 506-8701.

DEFINITION OF TERMS

Terms related to streamflow and other hydrologic data as used in this report are defined below:

Acre-foot (ac-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,560 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool.

Control designates a feature downstream from the gage that determines the stage-discharge relation at the gage. This feature may be a natural constriction of the channel, an artificial structure, or a uniform cross section over a long reach of the channel.

Control Structure as used in this report is a structure on a stream or canal that is used to regulate the flow or stage of the stream.

Cubic Foot per Second (cfs) is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to approximately 7.48 gallons per second or 448.8 gallons per minute or 0.02832 cubic meters per second.

Cubic foot per second-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, or about 646,000 gallons or 2,445 cubic meters.

Daily Mean Discharge is the average discharge in cfs for a 24 hour period from midnight to midnight the following day.

Discharge is the volume of water (or more broadly, total fluid plus suspended sediment), that passes a given point within a given period of time.

Drainage Area of a stream at a specified location is that area, measured in a horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the stream above the specified point.

Drainage Basin is a part of the surface of the Earth that is occupied by a drainage system, which consists of a surface stream or body of impounded surface water, together with all tributary surface streams and bodies of impounded surface water.

El Niño is a condition where sea surface temperatures are warmer in the eastern Pacific Ocean and cooler in the western Pacific Ocean in the lower latitudes. Normal conditions of sea surface temperatures are opposite with warmer waters in the western Pacific and cooler waters in the eastern Pacific. El Niño conditions may result in higher than normal precipitation in the southwestern United States.

Flood Elevation Frequency refers to the magnitude (in terms of depth or elevation) and probability of floods at a given flood control impoundment structure. The flood elevation frequency is usually given as a depth or elevation of impoundment associated with a given recurrence interval at a particular flood control impoundment structure.

Flood Flow Frequency refers to the magnitude (in terms of peak discharge) and probability of floods at a given gaging station. The flood flow frequency is usually given as a peak discharge associated with a given recurrence interval at a particular gaging station.

Gage or Gauge, refers to a measuring device, whether active, such as a pressure transducer, or bubbler orifice, or a passive device, such as a staff gage, or crest-stage gage.

Gage Datum is the elevation of the zero point of the reference gage from which gage height is determined. This elevation is established by a system of levels from known bench marks or by approximation from topographic maps or arbitrarily established to a known point such as a culvert invert elevation.

Gage Height is the water-surface elevation referred to some arbitrary gage datum. Gage height is often used interchangeably with the more general term "stage," although gage height is more appropriate when used with a reading on a gage.

Gaging Station is a particular site on a river, stream, canal, lake, or reservoir where systematic observations of hydrologic data are obtained.

Instantaneous Discharge is the discharge at a particular moment in time.

La Niña is a condition where above normal sea surface temperatures exist in the western Pacific Ocean and cooler than normal sea surface temperatures exist in the eastern Pacific Ocean. La Niña conditions usually result in drier than normal conditions in the southwestern United States.

Maximum Level is the highest pool level recorded or observed at a particular gaging station at a flood control impoundment structure for a particular event.

Maximum Storage is the greatest volume of water stored behind or within a flood control impoundment structure for a given event. This occurs at the maximum pool level and is obtained from the stage-storage relation for that maximum level for a particular flood control impoundment structure.

Mean Discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period.

Miner's Inch in Arizona is equal to 1/40 of a cubic-foot per second (cfs), or about 11.25 gallons per minute.

National Geodetic Vertical Datum of 1929 (NGVD 1929) is a geodetic datum derived from a general adjustment of the first order level nets of both the United States and Canada. It was formerly called "Sea Level Datum of 1929" or "mean sea level." Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place.

North American Vertical Datum of 1988 (NAVD 1988) is a datum based on the mass or density of the Earth instead of the varying values of the heights of the seas. Measurements of the acceleration of gravity are made at observation points in a network. Only one point is defined as the datum point. The vertical reference surface is then defined by the surface on which the gravity values are equal to the datum point value. This is called an equipotential surface.

Peak Discharge is the maximum instantaneous discharge for a given flood event.

Period of Record is the time period for which data exists for a given stream gaging station.

Pressure Transducer is an instrument used to measure the depth of water. It is an analog instrument which measures a pressure change over a diaphragm. The depth of water is related to the change in pressure over the diaphragm created by the weight of the water above the instrument.

Recurrence Interval is the reciprocal of the probability of a flood occurring in any given year. Thus, the flood having a 1% (1/100, or 1 in 100) chance of occurring in any given year has a recurrence interval of 100 years and is referred to as the 100-year flood. Similarly, the flood having a 50% (1/2 or 1 in 2) chance of occurring in any given year has a recurrence interval of 2 years and is referred to as the 2-year flood.

Staff Gage is a device located at the gaging station to provide a visual reference to the depth of water at a gage in terms of gage height above the water level measuring instrument.

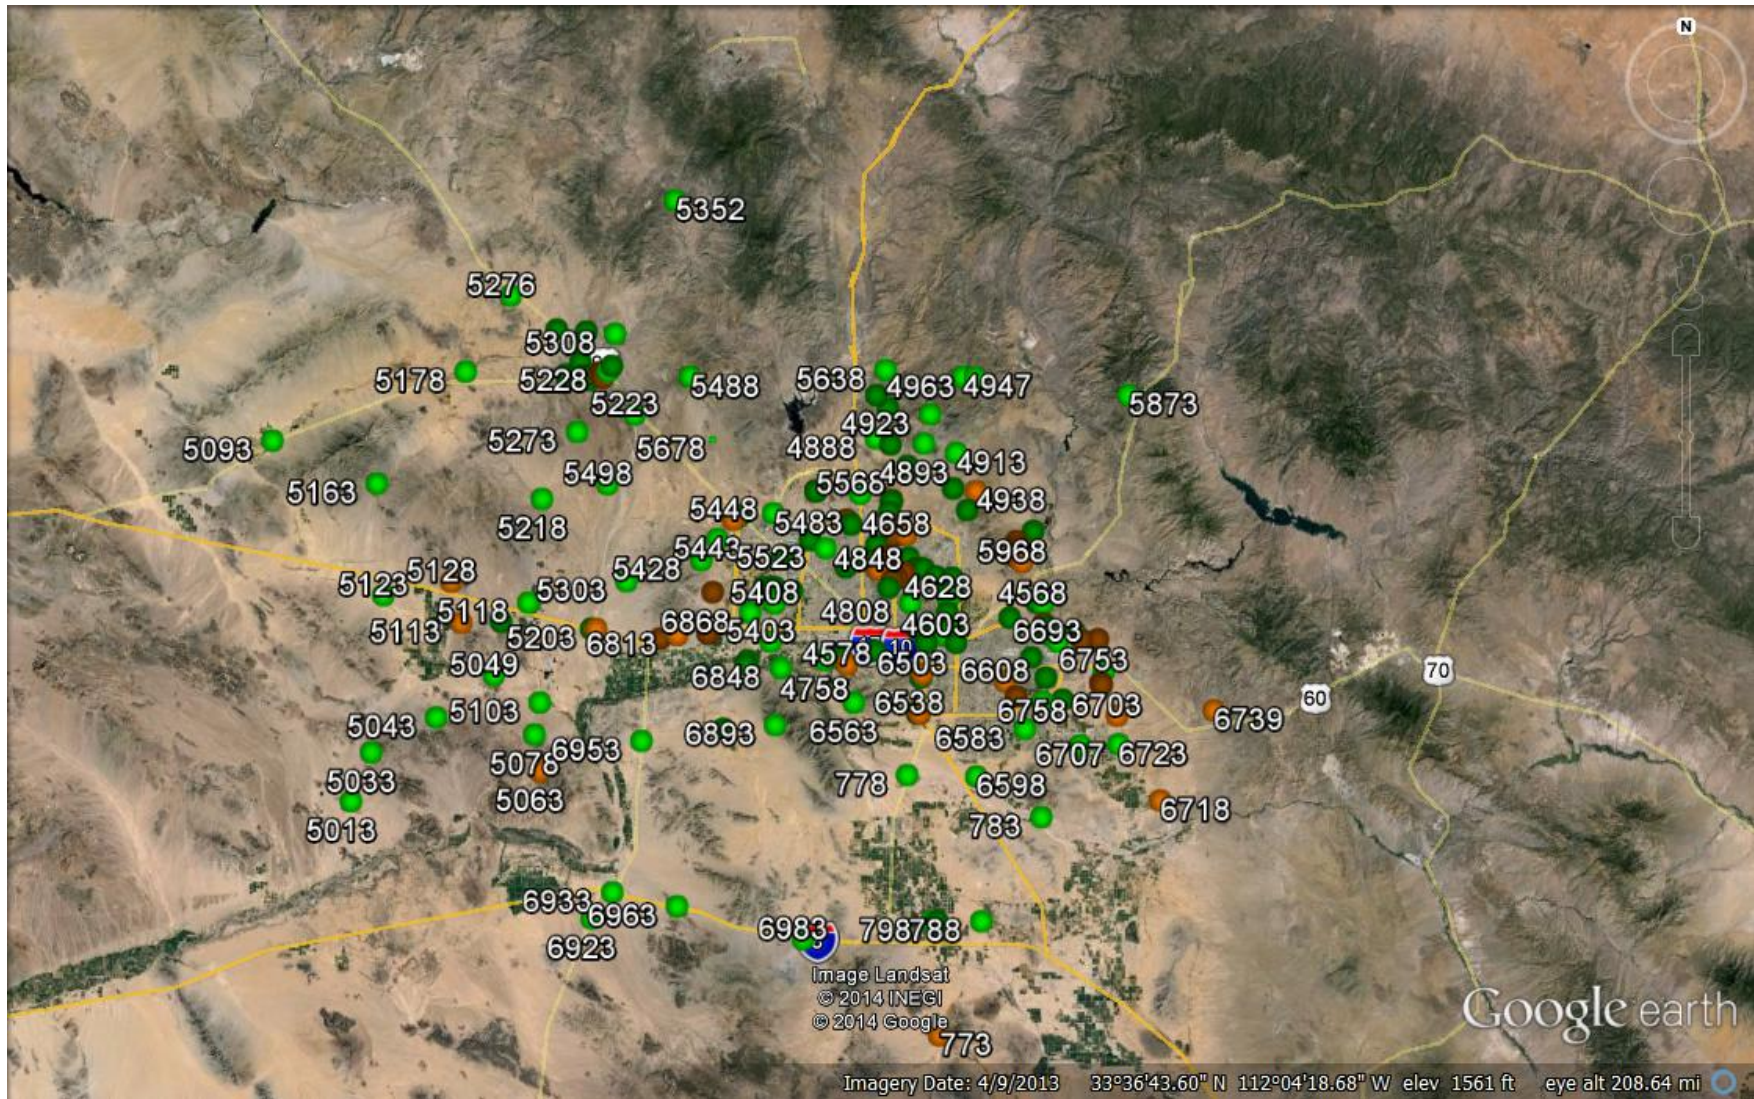

Stage-Discharge Relation is the relation between gage height (stage) and the volume of water, per unit of time, flowing in a channel or from a pipe or culvert.

Stage-Storage Relation is the relation between gage height (stage) and the volume of water stored behind or within a flood control impoundment structure.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff" as streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Water Year dealing with surface-water data is the 12-month period, October 1 through September 30. The water year is designated by the calendar year in which it ends and includes 9 of the 12 months. Thus, the water year beginning October 1, 2013 and ending September 30, 2014, is called the "2014 Water Year."

FCD STAGE GAGE LOCATIONS – WY 2014

Google Earth image with FCDMC stream gage stations

New Installations in Water Year 2014

There were three new streamgage stations established during Water Year 2014.

Cave Creek at CAP, #4907

EMF below Powerline Floodway, #6758

Pima Canyon Wash, #6523

Station Changes in Water Year 2014

- Spookhill FRS gages upstream of the outlet, Spookhill at McDowell (#6637), Spookhill at McKellips Rd. (#6638), and Spookhill at Brown Rd. (#6693) were converted from stream only stations to stream and storage stations.

SUMMARY OF SIGNIFICANT STREAMFLOW EVENTS

Rainfall and runoff in Maricopa County occurs during two distinct periods. From a water year standpoint, the water year begins with the onset of the winter rainy season, which stretches from October through March. The summer monsoon season begins around mid-June and continues through September.

The winter rain season was highlighted by two significant periods of rain. The first large rain / runoff event occurred around November 22, 2013 and lasted a few days. This event caused runoff mainly in the urban portions of Maricopa County, though the event was widespread throughout the county. December through February remained rather void of runoff. However, a large rainfall event produced runoff at many gages on March 1.

The summer rains began early with the first rain and limited runoff occurring on July 3. Following this, rain occurred in a handful of events in July, with just limited runoff. The northwest part of the county had runoff during an event of August 3. Then on August 12, South Mountain received significant rainfall and runoff. A tropical influx of moisture contributed to significant rainfall and record runoff for major drainages (New River, Cave Creek, and Skunk Creek) on August 19. Another significant tropical influx of moisture affected Maricopa County on September 8 again causing significant rainfall and runoff, with some 40+ stream stations recording record runoff. Finally, to cap off the season, another round of tropical moisture again resulted in significant runoff in Maricopa County on September 27.

Highlights of the runoff and impoundment events are summarized on the following two pages.

Maximum Flows for Water Year 2014 at Selected FCDMC Water Level Sensor Locations

*P = Pump; basin is drained via pump, not gravity flow.

Note: Many stations recorded multiple events. These are the peaks for the year.

DATA PRESENTATION

The following three sections present the data collected by the Flood Control District ALERT system. Data have been retrieved from a Hydrolynx® NovaStar5 database, maintained at the Flood Control District of Maricopa County.

The first section is Surface Water Streamflow data. This section contains data from free-flowing stream sites and discharges from dams and detention basins. The second section contains Pool Level data from storage structures, both dams and basins. The third section presents Storage Volume data for both dams and basins. The data are in acre-feet of storage volume.

In the tables where there are dashes “- - -” on a particular date or dates, the gage was down. Typically a gage is down when the gage itself fails, or a transmitter or repeater fails. In the case of transmitter failure or repeater failure, data for that date is available by manual download. However, when no event has occurred, the data will typically not be retrieved from the device.

*Gage ID was 0768 prior to January 24, 2000.

**FCD Operated gage since January 1998. However, this float gage did not operate properly. A pressure transducer gage was installed January 24, 2000 and all previous data were deleted. Previously, the US Army Corps of Engineers, Los Angeles District maintained a gage at this location.

See also Pool Level and Storage Volume data.

***NOTE:** The gage recorded a peak discharge of 145 cfs. However, the station failed during the peak event of September 8, 2014, where the peak discharge was estimated to be 155 cfs, which was determined from the high water mark observed on a staff gage after the event.

NOTE: Receding limbs of hydrographs may be significantly affected by clogging of outlet orifice. Therefore, low flows for falling hydrographs may be unrealistically high. See downstream station 4823 for a better representation of the falling limbs. Weir flow begins into main channel above 10 feet gage height.

NOTE: There are small flows coming periodically from a water storage facility about 500 feet north of the gage.

***NOTE:** The gage recorded a peak volume of 33 cfs. However, the station failed during the peak event of August 19, 2014, where the peak discharge was estimated to be 406 cfs and was estimated from the high water marks observed on the ground following the event.

Note: Significant vegetation is in the channel east of El Mirage Road, and causes water to back up to the gage station. A shift was applied to the data to show a flow of zero except when stages reach over 2.5 feet gage height. Much of the zero discharge data appears in the above table as "----" rather than blank. For this table only, '----' represents zero flow, not a down gage.

*Gage installed on December 21, 1998, replacing FCDMC gage #6863 at the old 115th Avenue Gila River crossing. Old gage was in service from November 6, 1997 until installation of new gage 6848.

**An undetermined amount of flow occurs more or less continually at this location without detection by the gage.

NOTE: USGS maintained a crest stage gage at this location from 11/27/1963 to 09/30/1979. In 1990, a joint USGS/FCDMC continuous station was installed. The USGS continuous station was discontinued 10/01/1994. Since Water Year 1995, the continuous station has been operated by the FCDMC and a crest-stage gage by the USGS.

Many days of impoundment due to irrigation tailwater. The gage is located inside a pump housing that, when stage reaches a certain level, pumps water from the gage house and basin. The daily stage values fluctuate substantially. Gage Heights above 10.0 feet are generally caused by storm events.

WTR YR 2014 MEAN 10.56 MAX 18.40 MIN 3.30

NOTE: Gage becomes disconnected from the USACOE gaging equipment on occasion. There may have been several impoundments behind the dam during the water year that may not have been recorded by FCDMC gaging equipment. For more information, refer to the *U. S. Army Corps of Engineers, Los Angeles District*.

Elevation of stage gage found to be at about 13.0 feet gage height, and made effective on January 1, 2014.

See also Surface Water Streamflow and Storage Volume data.

NOTE(1): This peak stage does not represent the greatest volume recorded at this station.

NOTE(2): Data appearing in the table represent water present in the inlet channel, but does not necessarily represent an impoundment. If an impoundment occurred, the peak would be recorded in the table at the top of the page. For WY 2014, there were several events with water in the inlet channel, and one large event that was an impoundment.

Many days of storage from irrigation tailwater. The gage is located inside a pump housing that, when stage reaches a certain level, pumps water from the gage house and basin. The daily stage values fluctuate substantially. Gage Heights above 10.0 feet are generally caused by storm events.

NOTE: Tie-in to Corps of Engineers gaging equipment was set up in August 2000. FCD gage was in operation since January 8, 1998. All FCD data prior to August 2000 has been deleted because it is believed that the gage did not operate correctly during that period. See U.S. Army Corps of Engineers, Los Angeles District for official information at this gage site.
