

Upper Sycamore Creek Weather Station

**Annual Hydrologic Data Report
Volume III: Weather Statistics
Water Year 2014**

PREFACE

This publication presents meteorological data collected by the Flood Control District of Maricopa County (FCDMC) automated ALERT system. Thirty-six telemetered weather stations are included in this report. Thirty-two of the stations are located within Maricopa County, two in Yavapai County, and two in Pinal County.

The weather data contained in this report were collected, compiled, and edited by the Flood Warning Branch of the Engineering Division. The information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, footnotes indicating periods of questionable and/or missing data have been added to the appropriate weather summaries. Although every possible means has been taken to provide accurate data, the liability for using this data falls upon the user and not the FCDMC.

This report is Volume 3 of a 3 volume suite entitled “Annual Hydrologic Data Report – Water Year 2014”. Volumes 1 & 2 in order are [1] Precipitation Report; and [2] Surface Water and Streamflow Report. Additional copies of this report, and copies of the companion volumes, may be purchased from:

INTRODUCTION

This publication is part of a three-volume report containing hydrologic and meteorological data collected by the Flood Control District of Maricopa County during Water Year 2014. This report is Volume III and contains weather station statistics. On-line users of this document have additional resources available by selecting hyperlinks. Weather Station names will link to the FCDMC web page for that weather station. Other hyperlinks will link within the document.

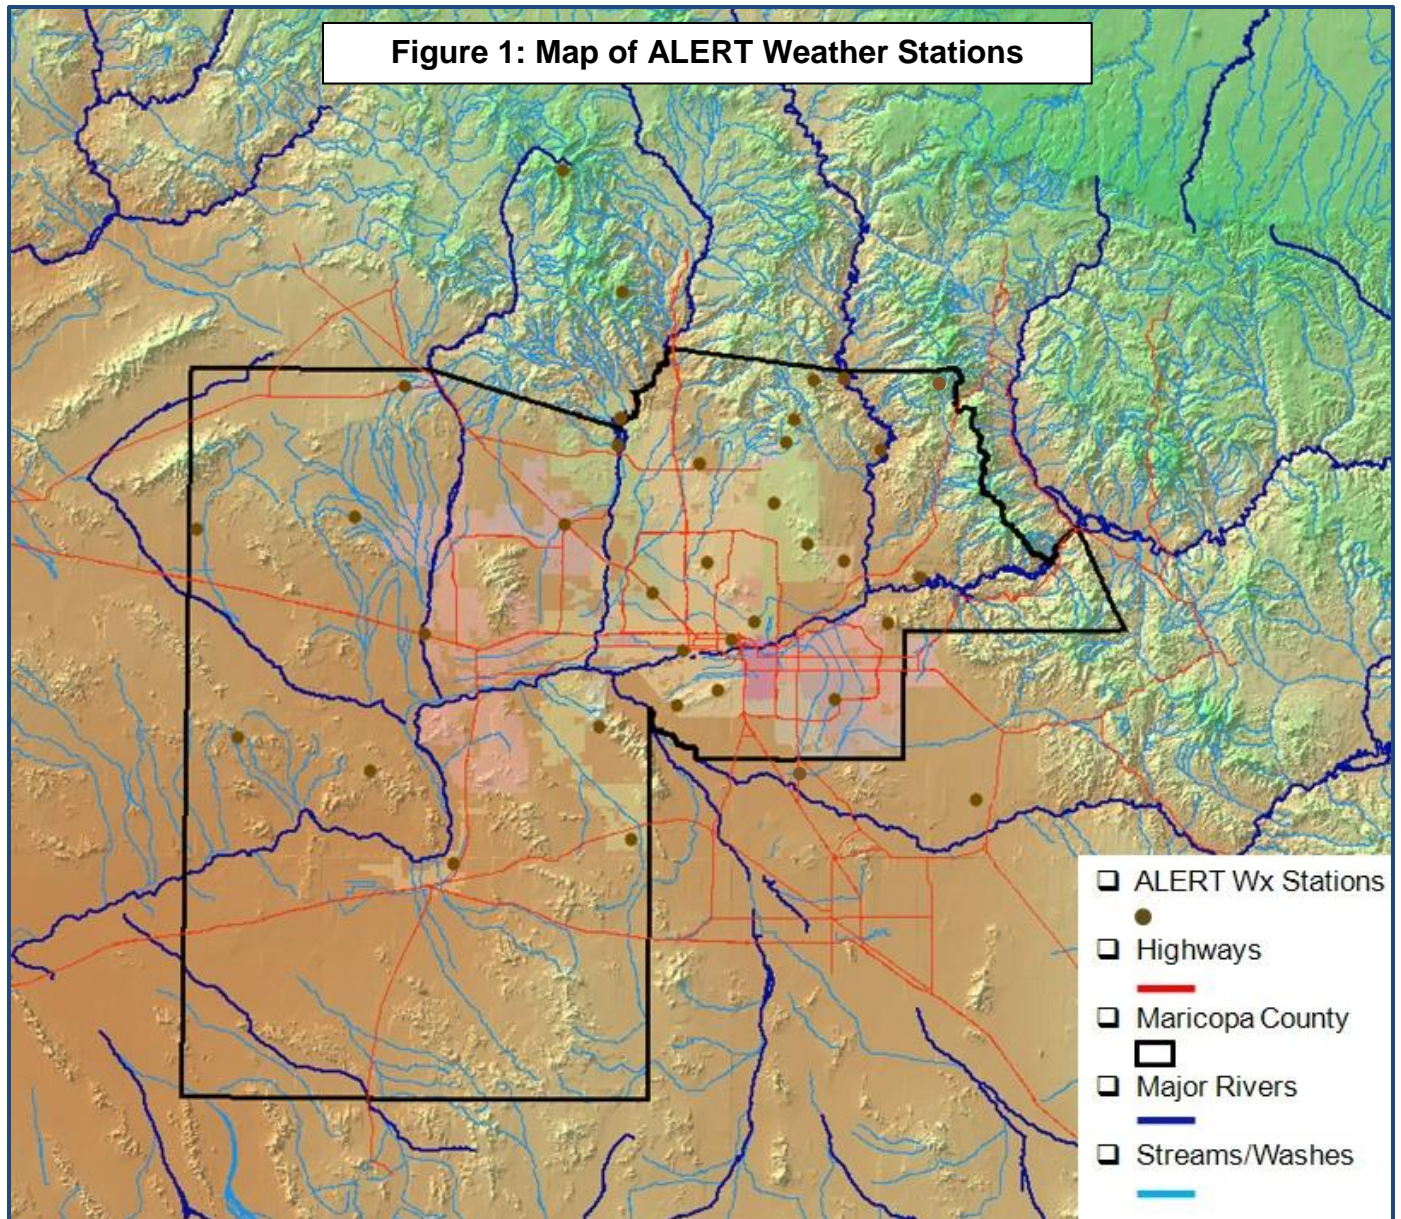

All weather stations report temperature and relative humidity; many also report a combination of wind direction, wind speed, barometric pressure and solar radiation. In addition dewpoint temperature is calculated at all weather stations using the temperature and relative humidity data. The temperature, relative humidity, and wind sensors record data every 15 minutes; the barometric pressure and solar radiation sensors every 30 minutes. Fifteen minute dewpoint temperatures are calculated by the ALERT computer using temperature and relative humidity data.

The following paragraphs describe the arrangement, collection, and compilation of the monthly weather station data contained in this report:

- Weather station data presented in the monthly weather summaries is based on the “2014 Water Year” which began on Oct. 1st, 2013 and ended Sept. 30th, 2014. Each monthly summary represents one weather station and lists daily weather station statistics by sensor. The monthly summaries are arranged chronologically by station name.
- An index of ALERT System weather stations, code names, locations, and installation dates is located on [page ix](#). This is followed by a sensor id number matrix listing the available sensors at each weather station. Both indexes are sorted by station name in alphabetical order. Station names are hyper linked to additional weather station information and climate summaries (where available).
- The monthly weather summaries contain daily maximum, minimum, and mean values for temperature and dewpoint. The monthly summaries also contain daily maximum and minimum values for relative humidity and barometric pressure. Finally, the monthly summaries contain daily maximum peak wind and solar radiation values. All of the ALERT System weather stations record precipitation; however that data is located in the [FCDMC Hydrologic Data Report Volume I](#).
- The unit of measurement for daily maximum, minimum, and mean temperature data is in degrees farenheight (°F). The daily maximum, minimum, and mean dewpoint data is in degrees farenheight (°F). The daily maximum and minimum relative humidity data is in percent (%). The daily maximum peak wind data is in miles per hour (mph). The daily maximum and minimum barometric pressure is in millibars (mb). The daily maximum solar radiation data is in watts per meter squared (w/m²).
- All data presented in the weather summaries is rounded to the nearest whole value. Additional and/or more detailed sensor data in hard copy or electronic copy is available for the weather station sensors listed in this report. Contact the FCDMC, Engineering Division, Flood Warning Branch at (602) 506-1501. Data can also be downloaded from our web site at <http://www.fcd.maricopa.gov/Rainfall/Weather/weather.aspx>.

Comments or discovered errors in regards to this report should be sent to the Flood Warning Branch via email which can be found on the [FCDMC ALERT System home page](#) or sent directly to Daniel Henz at danielhenz@mail.maricopa.gov.

General Map of ALERT Weather Station Locations as of 09/30/14

New Installations in Water Year 2014

There were no new weather stations installed during Water Year 2014

Station Changes in Water Year 2014

One weather station was moved in Water Year 2014.

- The Durango Complex weather station was relocated on 01/09/14 to the west of its previous location by 350ft and is pictured below. The station now sits over dirt and away from the pavement unlike its previous location. All sensors were retained at the new location and station data for Water Year 2014 is still filed under Durango Complex.

Summary of Significant Weather Events

The 2014 Water Year produced numerous noteworthy weather events. This section will discuss two of those events: An unusually moist August-September period which ultimately aided in the wettest monsoon season on record according to the FCDMC ALERT network and a warm spell in February that brought anywhere from 5-7 days (location dependent) of record breaking temperatures leading to an anomalously warm month. Short summaries of the moisture and temperature statistics during these periods are provided below.

Unusually Wet Second Half of the Monsoon Season:

According to the FCDMC ALERT rain gage network, the 2014 monsoon season was the wettest on record spanning the last 31 seasons. When averaged across the entire county mesonet, 6.92” of rain fell which was over double the mean Period of Record (POR) value of 3.04”. The majority of the rain that fell came over the second half of the monsoon season (August 15th-September 30th) from multiple significant and widespread rain events. The available moisture content around southcentral AZ that helped fuel these rain events was abnormally high from mid-August straight through to the conclusion of September.

Background:

Moisture advection into the Desert Southwest each summer is one of the key atmospheric players of the North American Monsoon (NAM). Source regions of this moisture include: the Gulf of California (GoC), eastern Pacific Ocean (E-Pac), and to a lesser extent the Gulf of Mexico. In general, moisture return into the state of AZ from these regions is achieved by multiple atmospheric mechanisms such as south/southeasterly flow around the monsoon ridge, gulf surges north out of the GoC, inverted troughs, tropical cyclones (hurricanes), or passing upper level troughs moving east out of the E-Pac. An in depth explanation of factors that modulate the NAM is beyond the scope of this summary, but readers can visit the NWS Tucson office’s NAM page [here](#) to learn more.

A key determining factor as to how much available moisture can be utilized via the mechanisms listed above involves looking at sea surface temperature (SST) variability in the Pacific source regions. The two main large scale and long term drivers of Pacific SST variability are the El Niño Southern Oscillation (ENSO) and the Pacific Decadal Oscillation (PDO). The positive (negative) phase of the ENSO, El Niño (La Niña), results in warmer (colder) than average SSTs across the equatorial E-Pac. More information on the underpinnings of the ENSO can be found [here](#). The positive (negative) or warm (cold) phase of the PDO results in anomalously warm (cold) SSTs across the north E-Pac, tropical E-Pac, and GoC. More information on the underpinnings of the PDO can be found [here](#). Understanding this variability is crucial as warmer than average SSTs associated with positive phases of these teleconnections lend to greater moisture flux off the water surface and subsequent available moisture for developing tropical cyclones, upper-level disturbances and subsequent gulf surges, etc.

ENSO neutral conditions persisted throughout the summer despite forecast models calling for a return of El Niño. It is worth noting SSTs anomalies across the equatorial Pacific switched from negative to positive during the spring season and remained weakly positive into fall. For the majority of the last seven years, the Pacific basin has been in the negative phase of the PDO. This trend abruptly switched to positive in March of this year (PDO Index values can be viewed [here](#) courtesy of National Climatic Data Center) and continued through the fall. A loop of global SST anomalies (departures from normal) during the March through October timeframe can be viewed

[here](#). Resulting anomalously warm SSTs across the E-Pac and GoC are believed to have played a large role in the abnormally high moisture content and the extended duration of this moisture across southcentral AZ during the 2014 NAM especially in conjunction with the atmospheric mechanisms described above. For more information on the 2014 monsoon season, readers are directed to view the [MSP Verification Report and Season Recap: Monsoon Season 2014](#).

Data Summary:

Twenty-three weather stations were chosen for this summary. These stations were chosen namely as they all have periods of operational record greater than 10 years and include calculated climate summaries listed on the [FCDMC Weather Information](#) webpage. These stations vary in location covering the greater Metropolitan Phoenix area within Maricopa County as well as portions of Yavapai and Pinal counties. Station elevations range from 1,050ft to 7,495ft. The applicable stations are listed in Table 1 (below).

TABLE 1: Avg. Moisture Content Compared to Normal (Aug 15th-Sept 30th)							
Station Data				Dewpoint		Relative Humidity	
Weather Station	Elev. (ft)	POR (yrs.)	Sensor ID	2014 Mean (°F)	Normal Mean (°F)	2014 Mean (%)	Normal Mean (%)

Wickenburg Airport	2,385	21	7122	53.8	47.6	43.0	35.4

Table 1 (above) compares various moisture data at each of the twenty-three ALERT weather stations during the August 15th-September 30th time period. The left third of the table covers

weather station information including station elevation, period of record, and the four digit temperature sensor ID number. The middle third of the table includes the 2014 mean period dewpoints and normal mean dewpoints during the period. The right third of the table includes the 2014 mean period relative humidity and the normal mean relative humidity during the period. Values highlighted in red, within the 2014 mean moisture columns, represent new records for the period.

During the period from August 15th through September 30th 2014, each one of the 23 weather stations experienced above average mean dewpoint and relative humidity values when compared to that station’s normal mean value. Looking at the dewpoint data revealed that 13 of the 23 stations set a record for the greatest average dewpoint over the period of record. Looking at the relative humidity data revealed that 12 of the 23 stations set a record for the greatest average relative humidity over the period of record. Even more important, new records were set at stations over the lower deserts encompassing the Phoenix Valley as well as across the higher terrain regions of northern and eastern Maricopa County. Similarly, there seems to be an even distribution of stations that set records located within the urbanized Phoenix Valley and across rural desert locations.

TABLE 2: Moisture Statistics (Aug 15th-Sept 30th)

Station Data		Dewpoint			Relative Humidity		
Weather Station	Elev. (ft)	Anomaly (°F)	Std Dev (°F)	Stdized Anomaly	Anomaly (%)	Std Dev (%)	Stdized Anomaly

Table 2 (on the previous page) compares various moisture statistics at each of the twenty-three ALERT weather stations during the August 15th-September 30th time period. The left third of the table covers weather station information including station elevation. The middle third of the table includes the 2014 dewpoint anomaly (departure from the mean), standard deviation over the period of record, and the 2014 standardized dewpoint anomaly. The right third of the table includes the 2014 relative humidity anomaly (departure from the mean), standard deviation over the period of record, and the standardized relative humidity anomaly. Standardized anomalies exceeding 1.50 are highlighted in red.

Looking at the dewpoint data, the average anomaly for all stations was 7.0°F as 19 of the 23 stations experienced a 5.0°F or greater positive anomaly during the period. When looking at the relative humidity data, the average anomaly for all stations was 9.9% and just over a third (8 of 23) of the stations had greater than a 10% positive anomaly. Standard deviations were then calculated to observe the variability of the dewpoint and relative humidity data sets at each weather station over individual periods of record. The greater the standard deviation, the less historically meaningful the 2014 anomalies were. An easy way to objectively analyze the data was to normalize the anomalies.

Standardized anomalies (SA) were calculated using the anomaly and standard deviation data at each station. SAs are used with weather data to find statistical outliers (uncommon events) in data sets after removing bias. Values can be positive or negative, but the data sets above were all positive meaning greater moisture content than normal. Values between zero and one mean the anomaly fell within one standard deviation of normal or in this case a common event. Values greater than one are outliers and in this case the greater the value, the more uncommon the event is. Finally, SAs are dimensionless meaning different weather variables with separate units can be directly compared.

Twenty-one of the 23 dewpoint SA were greater than 1.00 with 12 of the 23 exceeding 1.50 times the standard deviation. Similarly, 22 of the 23 relative humidity anomalies were greater than 1.00 with 12 of the 23 exceeding 1.50. 15 of 23 stations recorded their greatest dewpoint SA and 11 of 23 stations recorded their greatest relative humidity SA in 2014. In either data set the average SA combined across all weather stations (not shown) was greater than 1.50 and was the highest of any other year in the period of record at 1.55 (dewpoint) and 1.54 (relative humidity) respectively.

February Heat Wave:

Periods of unusually warm temperatures are not uncommon to the Phoenix area during the winter months (DJF). The 2014 Water Year produced several abnormally warm periods this past year, but none was more significant than the one-week heat wave during February 13th-19th. According to the National Weather Service (NWS) Phoenix office, new or matched daily high temperatures were recorded for five days in a row at Sky Harbor Airport on February 14th-18th. Furthermore, February 2014 officially went down as the second warmest on record in terms of high, low, and average temperature at 76.8°F, 48.7°F, and 64.4°F respectively.

Twenty-three weather stations were chosen for this summary. These stations were chosen namely as they all have periods of operational record greater than 10 years and include calculated climate summaries listed on the [FCDMC Weather Information](#) webpage. These stations vary in location covering the greater Metropolitan Phoenix area within Maricopa County as well as portions of Yavapai and Pinal counties. Station elevations range from 1,050ft to 7,495ft. The applicable stations are listed in Table 1 (on the next page):

Table 1: Daily High Temperatures, February 2014

Table 1 (above) shows the daily high temperatures at each of the twenty-three ALERT weather stations during February 13th-19th of 2014. The left half of the table includes weather station information comprising of station elevation, period of record, and the four digit temperature sensor ID number. The right half of the table shows the max temperature value for each day in the period. Values highlighted in red, represent new maximum temperatures records for the day.

During the one week period from February 13th-19th 2014, all 23 of the weather stations set a least one record high temperature during the seven day span. Even more impressive, 7 stations logged a record high temperature on each of the seven days. The average high temperature exceeded 80.0°F February 14th-18th. February 15 had the warmest average high temperature during the period at 83.7°F followed closely by February 17th at 82.6°F.

Table 2 (on the next page) compares various temperature data at each of the twenty-three ALERT weather stations during the month of February. The left third of the table covers weather station information including station elevation, period of record, and the four digit temperature sensor ID number. The middle third of the table includes the 2014 mean February 13th-19th temperatures, normal mean February temperatures during that period, and the temperature anomalies over the

period. The right third of the table includes the 2014 mean February temperatures, the normal mean February temperatures, and the temperature anomalies. Values highlighted in red, within the 2014 mean temperature columns, represent new records for the period.

Each one of the 23 weather stations experienced an above normal average temperature value in 2014 when compared to that station's normal mean temperature. Perhaps even more significant, 19 of 23 weather stations matched or set records for the warmest mean temperature during that week span. Looking at the temperature anomalies, 15 of the 23 stations experienced a 10.0°F or greater warm anomaly during the period. Going a step further, standardized anomalies were calculated at each station (not shown). Eighteen of the 23 station's standardized anomalies exceeded 2.00 times the normal standard deviation at their respective stations and none were less than 1.50.

There is no doubt temperatures during the middle of February 2014 were well above normal, but what about the month as a whole? Thirteen of the 23 matched or set records for the warmest mean temperature for the month of February. Looking at temperature departures, the average warm anomaly was 5.1°F with 14 of the 23 weather stations experiencing a 5.0°F or greater warm anomaly. Standardized monthly temperature anomalies were also calculated at each station (not shown) for more historical perspective. Thirteen of the 23 station's standardized anomalies exceeded 1.50 times the normal standard deviations and 5 exceeded 2.00.
