

Aguila VFD Weather Station

**Annual Hydrologic Data Report
Volume III: Weather Statistics
Water Year 2015**

PREFACE

This publication presents meteorological data collected by the Flood Control District of Maricopa County (FCDMC) automated ALERT system. Thirty-eight telemetered weather stations are included in this report. Thirty-four of the stations are located within Maricopa County, two in Yavapai County, and two in Pinal County.

The weather data contained in this report were collected, compiled, and edited by the Flood Warning Branch of the Engineering Division. The information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, footnotes indicating periods of questionable and/or missing data have been added to the appropriate weather summaries. Although every possible means has been taken to provide accurate data, the liability for using this data falls upon the user and not the FCDMC.

This report is Volume 3 of a 3 volume suite entitled “Annual Hydrologic Data Report – Water Year 2015”. Volumes 1 & 2 in order are [1] Precipitation Report; and [2] Surface Water and Streamflow Report. Additional copies of this report, and copies of the companion volumes, may be purchased from:

**Flood Control District of Maricopa County

INTRODUCTION

This publication is part of a three-volume report containing hydrologic and meteorological data collected by the Flood Control District of Maricopa County during Water Year 2015. This report is Volume III and contains weather station statistics. On-line users of this document have additional resources available by selecting hyperlinks. Weather Station names will link to the FCDMC web page for that weather station. Other hyperlinks will link within the document.

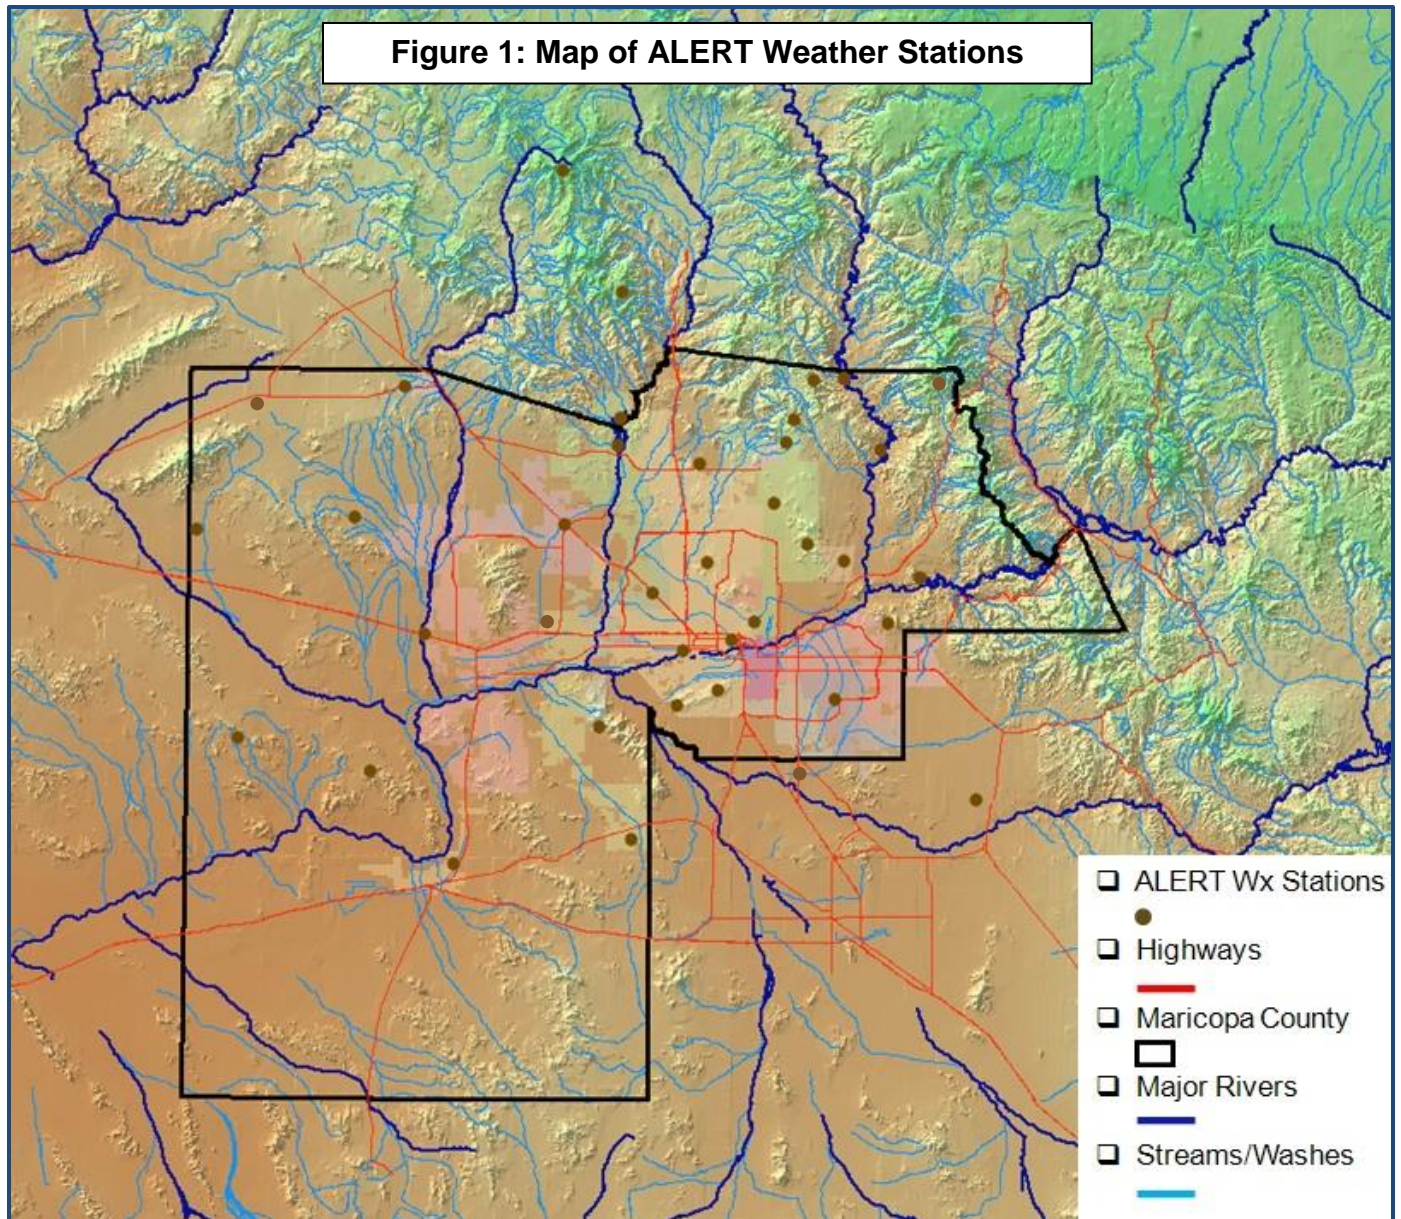

All weather stations report temperature and relative humidity; many also report a combination of wind direction, wind speed, barometric pressure and solar radiation. In addition dewpoint temperature is calculated at all weather stations using the temperature and relative humidity data. The temperature, relative humidity, and wind sensors transmit data every 15 minutes; the barometric pressure and solar radiation sensors every 30 minutes. Fifteen minute dewpoint temperatures are calculated by the ALERT computer using temperature and relative humidity data.

The following paragraphs describe the arrangement, collection, and compilation of the monthly weather station data contained in this report:

- Weather station data presented in the monthly weather summaries is based on the “2015 Water Year” which began on Oct. 1st, 2014 and ended Sept. 30th, 2015. Each monthly summary represents one weather station and lists daily weather station statistics by sensor. The monthly summaries are arranged chronologically and by station name.
- An index of ALERT System weather stations, code names, locations, and installation dates is located on [page ix](#). This is followed by a sensor id number matrix listing the available sensors at each weather station. Both indexes are sorted by station name in alphabetical order. Station names are hyper-linked to additional weather station information and climate summaries (where available).
- The monthly weather summaries contain daily maximum, minimum, and mean values for temperature and dewpoint. The monthly summaries also contain daily maximum and minimum values for relative humidity and barometric pressure. Finally, the monthly summaries contain daily maximum peak wind and solar radiation values. All of the ALERT System weather stations record precipitation; however that data is located in the [FCDMC Hydrologic Data Report Volume I](#).
- The unit of measurement for daily maximum, minimum, and mean temperature data is in degrees farenheight (°F). The daily maximum, minimum, and mean dewpoint data is in degrees farenheight (°F). The daily maximum and minimum relative humidity data is in percent (%). The daily maximum peak wind data is in miles per hour (mph). The daily maximum and minimum barometric pressure is in millibars (mb). The daily maximum solar radiation data is in watts per meter squared (w/m²).
- All data presented in the weather summaries is rounded to the nearest whole value. Additional and/or more detailed sensor data in hard copy or electronic copy is available for the weather station sensors listed in this report. Contact the FCDMC, Engineering Division, Flood Warning Branch at (602) 506-1501. Data can also be downloaded from our web site at <http://www.fcd.maricopa.gov/Weather/weather.aspx>.

Comments or discovered errors in regard to this report should be sent to the Flood Warning Branch via email at FloodInfo@mail.maricopa.gov or sent directly to Daniel Henz at danielhenz@mail.maricopa.gov.

General Map of ALERT Weather Station Locations as of 09/30/15

New Installations in Water Year 2015

There were two new weather stations installed during Water Year 2015

- Camelback Rd@ Citrus Rd, precipitation gage site, was upgraded to a weather station, Code # CRC, in January 2015. Sensor 5420 was retained at the location. Sensors for Peak Wind (5414), Wind Speed/Direction (5404), Relative Humidity (5409), and Temperature (5417) were added at the location and began transmitting data on January 22, 2015. All weather station data for Water Year 2015 are filed under Camelback @ Citrus.

- Aguila VFD, precipitation gage site, was upgraded to a weather station, Code # AFD, in March 2015. Sensor 5155 was retained at the location. Sensors for Peak Wind (5154), Wind Speed/Direction (5159), Relative Humidity (5157), and Temperature (5158) were added at the location and began transmitting data on March 26, 2015. All weather station data for Water Year 2015 are filed under Aguila VFD.

Station Changes in Water Year 2015

One weather station was moved in Water Year 2015.

- The Mount Union weather station was relocated on 12/08/14 to the north of its previous location by 100ft and is pictured below. The station still sits over dirt and away from the pavement similar to its previous location. All sensors were retained at the new location and station data for Water Year 2015 is still filed under Mount Union.

ALERT2 Rollout

The Flood Control District of Maricopa County (the District) operates, monitors, and maintains a robust network of automated environmental monitoring stations comprised of weather, rain, and water-level sensors. The District's mesonet utilizes ALERT protocol, which stands for Automated Local Evaluation in Real Time, for sampling and then transmitting sensor data back to receiving base stations before being distributed to its users. ALERT has been the standard for real-time environmental data collection for the last four decades, but is now being phased out in favor of ALERT2. The District recently completed the first stage of ALERT2 adoption and in Water Year 2015 began upgrading weather stations. A short summary of ALERT2 is provided below.

Background:

ALERT was developed in California in the 1970s by the National Weather Service as a format for data transmission and for the manufacture of compatible hardware and software. ALERT protocol was optimized for the transport of data over radio telemetry networks utilizing VHF or UHF radio frequencies. It was originally intended as a means for the collection of real-time rainfall data to support analysis and decision making, but was quickly expanded to include various other meteorologic and hydrologic parameters as well as other control applications. Successful early adoption led to the development extensive of ALERT systems across the United States and around the world as a cost-effective and reliable way to improve flood warning programs. The District began installing its ALERT system in 1980 after the late 1970's floods and continues to grow to this day. More information on the District's ALERT system can be found [here](#).

ALERT was quickly adopted by the hydrologic and meteorologic (hydromet) communities for several key strengths. Its high energy transmission was very capable for long and indirect paths between stations/repeaters and base computers. Furthermore, lower power consumption requirements were advantageous for remote sites which were common in ALERT networks across the western United States. Its architecture allowed for redundant receive point capability with broadcast, meaning networks could be constructed with multiple fail-safe options and data could be easily shared between networks. Finally, ALERT was developed as an open standard which was meant for encouraging competition between multiple vendors.

Limitations and the need for ALERT2:

Despite all of its assets, users still had to accommodate its known limitations. ALERT was constructed as an ALOHA system in regards to data transmission, meaning that every gaging site would report independently, without regard to other traffic on the channel. In certain instances, such as a heavy rain event, data collisions would lead to large losses in data. Fortunately, transmitted rainfall data could be reconciled by comparing the current value to a previously received value. However, this was not the case with analog measurements (water-level or weather sensors) where data can't be recovered. Over the years, many ALERT networks saw further problems with increased channel congestion as input traffic increased due to expanding networks.

In terms of transmission size, ALERT data packets were limited to 24 bits. 13 bits were used as a signal identifier and the remaining 11 bits contained the station data. This ultimately limited the number of sensor identifiers to just over 8,000 and data resolution was limited to "0-2047". In terms of transmission speed, ALERT operated at 300 baud and the data throughput was approximately 72 bit/sec. The FCC recently announced that as of 2020 systems with this low channel efficiency would no longer be licensable due to new regulations on narrowbanding.

Several other key limitations included: inability to transmit engineering units, no message routing or two-way communications between a base station and gaging site, and incapability to create many other broad use control applications.

Ultimately, it was decided that ALERT lacked the flexibility to meet the current and future needs of the hydromet community and FCC regulations mandated the need for change. In response, a committee was formed in 2001 made up of vendors and users tasked with the development of ALERT2. The first feasibility study was conducted in 2002 which verified that ALERT technology could be expanded to reconcile prior limitations but be flexible enough for future innovation. Working prototypes were developed by 2008 and users quickly began field-testing hardware and software as of 2010. Initial rollout to various legacy networks started quickly after the official press release in September of 2011.

ALERT2:

ALERT2 is the next generation wireless communication protocol for use in real-time hydromet monitoring systems. Like ALERT, ALERT2 is still a system for transporting short data messages over terrestrial radio paths. It continues to feature all the advantages of the legacy system, but without the compromises.

Some advantages over ALERT include:

- Collision free data transmission using Time Division Multiple Access (TDMA). All hardware/software is synched utilizing GPS technology and each transmitter is assigned a unique time slot to transmit. ALERT2 can also be used in ALOHA mode with a reduction in potential transmission errors.
- Data error detection and correction lending to error-free data
- Data rate increases from 300 to 4800 baud which translates to data speeds around seven to ten times faster than ALERT. Higher speeds lend to increased data capacity. Multiple sensors can be sent simultaneously.
- Station ID range greatly expanded to “1-65,534” and now coupled with Sensor IDs ranging from “0-254” to identify a data value. 32bit integer data range with a resolution from “-2,147,483,648 – +2,147,483,648”.
- Data calibration can be completed at the gaging site and data can be transmitted in engineering units
- Potential to add future functionality due to message design including: two-way communications, message routing, and flexible messages.
- Source Address Management System which provides a simple web-based application for system owners to request addresses (ID numbers) for specific sites.

A complete description of the ALERT2 protocol is beyond the scope of this summary, but interested readers are highly encouraged to view the ALERT2 Technical Working Group site on the National Hydrologic Warning Council webpage, [here](#). For more technical information users are invited to peruse the ALERT2 online document portal, [here](#).

FCDMC ALERT2 Rollout:

As highlighted above, the District recently completed the first stage of ALERT2 adoption by converting its base station hardware and software. Since that time, instrumentation staff has begun the long process of converting individual stations and repeaters, including weather stations. The weather station conversion process involves installing an upgrade kit to the station's transmitter. Then, the weather station's new Station ID and Sensor IDs are added into the database management software. Ultimately, the transition between ALERT and ALERT2 should be seamless to end users and moving forward users should expect to see less data gaps that were a result to data collisions and channel congestion as the District's system takes advantage of ALERT2's TDMA technology.

Durango Complex was the first weather station to be upgraded to ALERT2 back in February of 2015. To date, eleven of the thirty-eight weather stations have been upgraded to ALERT2. Ten were completed during Water Year 2015 and the eleventh, Buckeye FRS #1, was completed shortly before the finalization of this report. Upgraded stations are included in Table 1, below. Complete rollout to all District weather stations should be finalized before the end of Water Year 2017.
