

**FCDMC ALERT SYSTEM
ANNUAL SURFACE WATER REPORT
WATER YEAR 1995**

PREFACE

This publication presents the surface water data collected by the Flood Control District of Maricopa County's automated water level gage network. This telemetered network is located primarily throughout Maricopa County, Arizona with additional gages in Yavapai, Pinal, and La Paz Counties.

The surface water data contained in this report was collected, compiled and edited by the Flood Warning and Data Collection Branch of the Engineering Division. Data includes mean daily, total, maximum, and minimum discharges at the flow sites; mean daily, maximum, and minimum pool levels at the storage locations; and mean daily, maximum, and minimum volumes stored at the storage locations. The information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, footnotes have been included to identify questionable data. Reliance upon the accuracy, reliability, and authority of this information is solely the responsibility of the user.

Revisions to any of these data for any reason will be published in an appendix of the following years' reports.

Additional copies of this report may be purchased from:

Revisions to Prior Water Years.....	Appendix

INTRODUCTION

The Flood Control District of Maricopa County in cooperation with local, state, and federal agencies collects a large amount of data pertaining to surface water runoff in and around Maricopa County. These data provide a valuable resource for information not otherwise furnished by the traditional sources of this type of material. To make these data readily available to interested parties outside the Flood Control District, the data are published annually in this report entitled "FCDMC ALERT System Annual Surface Water Report."

This report includes records on discharge at uncontrolled stream gages and at flood control storage structures, on depths at flood control storage structures, and on contents at flood control storage structures. Specifically it contains: (1) Discharge records at 38 uncontrolled stream gages and 24 flood control storage structures; (2) Depths of stored water at 25 flood control storage structures; and (3) Contents at 24 flood control storage structures. Records included are only a small fraction of those obtained for each site during this water year.

A number of streamflow gages collected by the FCDMC ALERT System are run cooperatively with the United States Geological Survey (USGS). Although real-time data for these sites are collected at the FCDMC for the purposes of flood event monitoring, quality control for the data at these gages lies with the USGS. The official records for these sites are published in the USGS Surface Water Data Reports each water year. The cooperative gages collected jointly for Water Year 1995 were:

<u>USGS Gage Name</u>	<u>FCDMC ID</u>	<u>USGS ID</u>
Vekol Wash near Stanfield, AZ	6983	09488650
Salt River at Priest Drive	4523	09512165
Cave Cr. below Cottonwood Cr.	4923	09512280
Agua Fria River at El Mirage	5503	09513650
Skunk Creek near Phoenix, AZ	5568	09513860
New River near Glendale, AZ	5508	09513910
Gila River @ Estrella Parkway	6853	09514100
Centennial Wash at SPRR	5103	09517490
Gila River near Sacaton, AZ	0783	09478350
Gila River near Maricopa, AZ0778		09479350

This is the second annual surface water report published by the District. Prior to water year 1994, surface water data collected by the FCDMC ALERT System were not quality controlled, and therefore, not published. However, there are data resident in archives prior to water year 1994 that may have value to specific individuals. The FCDMC ALERT System began collecting data as early as 1980.

The data are collected as a depth of flow in feet to the nearest tenth of a foot. The discharge and/or contents is then obtained by applying the stage to a rating curve of stage versus discharge in cubic feet per second (cfs), or stage versus contents in acre-feet (ac-ft). The discharge rating curves have been developed at stream gages by using field surveyed cross sections in a HEC-2 step backwater computer model to obtain a range of stage versus discharge points to be plotted on a curve. The discharge rating curves at flood control storage structures were developed by application of the Federal Highway Administration's HY-8 computer model for culvert flow and US Geological Survey methods for flow over the uncontrolled emergency spillways. The storage rating curves were obtained from published as-built or construction plans or developed from digital elevation data. Efforts are made to keep all of the rating curves as up to date as possible. This includes supplementing step backwater derived rating curves with direct discharge measurements whenever possible. Also, channel reaches are resurveyed after major events for revision of the rating curves. Similarly, stage versus contents curves are updated whenever newer, more accurate topographic data become available.

Daily mean discharges are computed as follows: first, the discharge for each recorded stage value (gage height) is computed from the stage-discharge curve or table. Once rated, the rated values are time weighted to arrive at the mean value for the day. Daily mean storage facility contents (volume) are computed in similar fashion.

The minimum and maximum values are based on instantaneous readings and the volumes for discharge stations are based on accumulations of daily means. In general, the maximum values for instantaneous discharge, reservoir depth, and storage volume can be assumed to have occurred on the day with the largest daily mean. In some cases, all days for the month show a daily mean flow or storage volume of zero while the maximum instantaneous flow or stored volume is a positive value. This occurs because the daily mean value rounds off to zero when no decimal points are shown. In these cases, the day of maximum discharge or storage is indicated in a footnote.

Gages in section 2, Pool Levels at Storage Facilities, which show a continuous gage height during obvious periods of no storage, do so because the orifice to the pressure transducer is set at that gage height above 0.0' gage datum. The date of maximum depth may also be indicated in a footnote when all days show the offset value.

All of the data in this report have been reviewed and edited in an attempt to provide the most accurate data possible. A blank or blanks within the data set is an indication that data was lost either due to hardware, software, or radio problems, or that the gage had not yet been installed. Where possible, these data are flagged with footnotes describing the time the gage was down.

An index of gage names, numbers, locations, and other descriptors is included following the Definition of Terms in this report.

Additional or more detailed surface water data in hard copy or computer disk format is available for the gages listed in this report. Contact the Flood Control District, Engineering Division, Flood Warning and Data Collection Branch at (602) 506-1501.

DEFINITION OF TERMS

Terms related to streamflow and other hydrologic data, as used in this report are defined below.

Acre-foot (ac-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,500 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool and does not include bank storage.

Control designates a feature downstream from the gage that determines the stage-discharge relation at the gage. This feature may be a natural constriction of the channel, an artificial structure, or a uniform cross section over a long reach of the channel.

Control structure as used in this report is a structure on a stream or canal that is used to regulate the flow or stage of the stream.

Cubic foot per second is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to approximately 7.48 gallons per second or 448.8 gallons per minute or 0.02832 cubic meters per second.

Cubic foot per second-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, or about 646,000 gallons or 2,445 cubic meters.

Discharge is the volume of water (or more broadly, total fluid plus suspended sediment), that passes a given point within a given period of time.

Mean discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period (either a given month or for the entire water year). The daily mean discharge is computed as the average of the discharges recorded for that day. The individually recorded discharge values are computed from the stage-discharge relationship for the given gage.

Instantaneous discharge is the discharge at a particular instant of time.

Drainage area of a stream at a specified location is that area, measured in a horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the stream above the specified point.

Drainage basin is a part of the surface of the Earth that is occupied by a drainage system, which consists of a surface stream or body of impounded surface water, together with all tributary surface streams and bodies of impounded surface water.

Gage datum is the elevation of the zero point of the reference gage from which gage height is determined as compared to the National Geodetic Vertical Datum of 1929 or similar datum. This elevation is established by a system of levels from known bench marks or by approximation from topographic maps. The gage datum also may be arbitrarily established as a reference point from which the rating curve may be determined.

Gage height is the water-surface elevation referred to some arbitrary gage datum. Gage height is often used interchangeably with the more general term "stage," although gage height is more appropriate when used with a reading on a gage.

Gaging station is a particular site on a stream, canal, lake, or reservoir where systematic observations of hydrologic data are obtained.

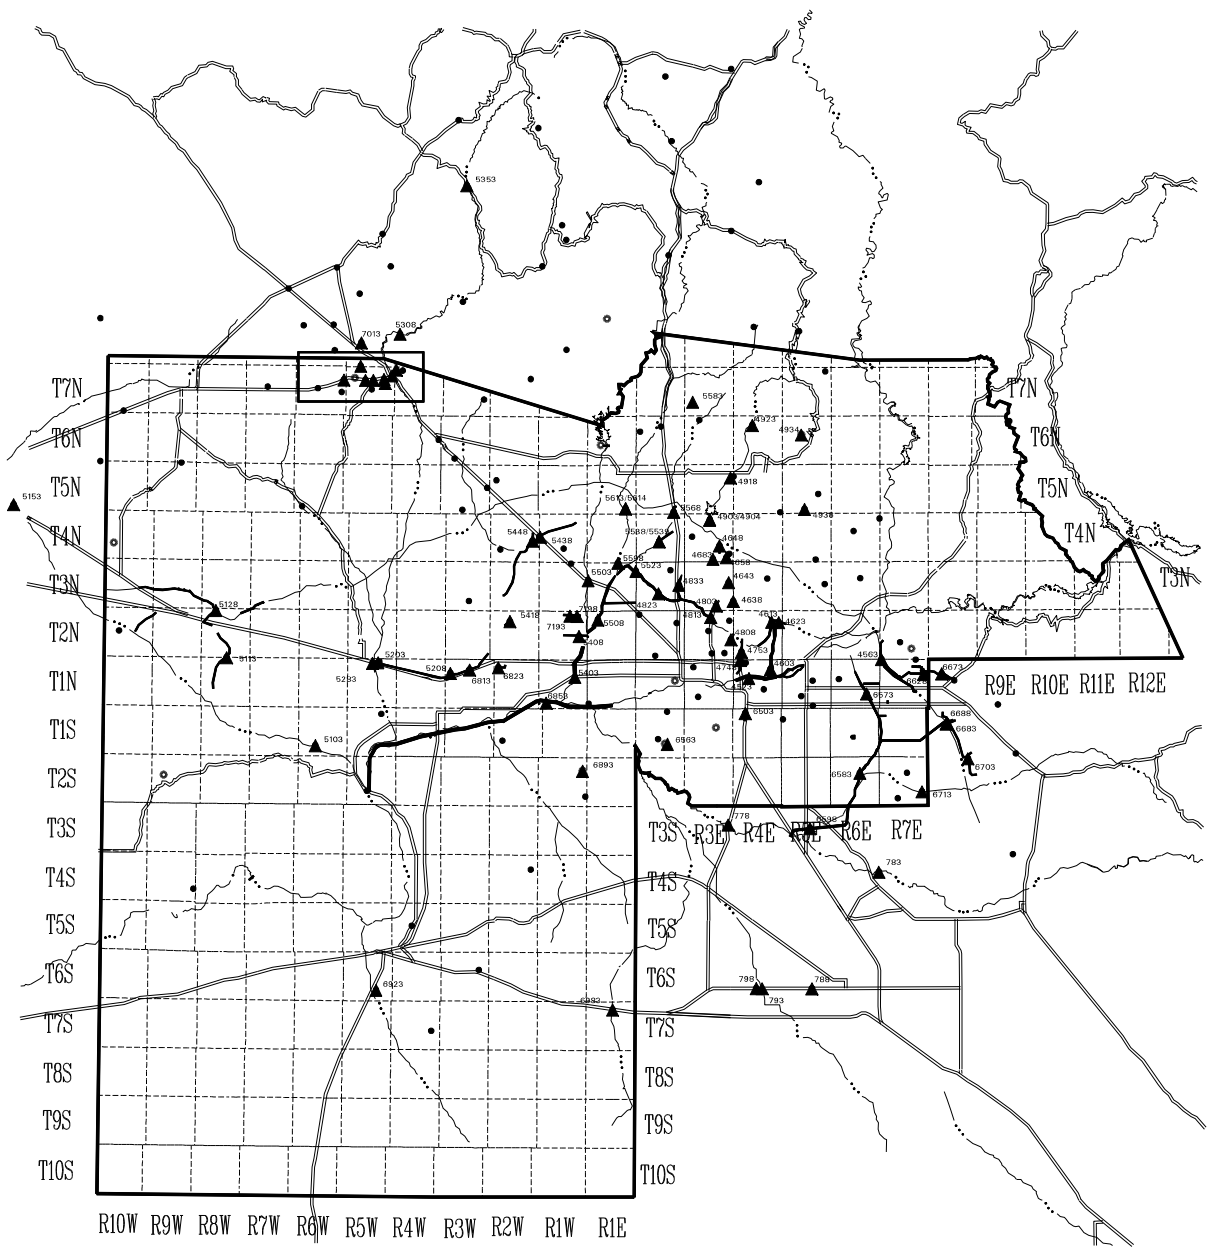

National Geodetic Vertical Datum of 1929 (NGVD 1929) is a geodetic datum derived from a general adjustment of the first order level nets of both the United States and Canada. It was formerly called "Sea Level Datum of 1929" or "mean sea level." Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place.

Stage-discharge relation is the relation between gage height (stage) and the volume of water, per unit of time, (discharge) flowing in a channel.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff" as streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Water year dealing with surface-water data is the 12-month period, October 1 through September 30. The water year is designated by the calendar year in which it ends and which includes 9 of the 12 months. Thus, the year ending September 30, 1995, is called the "1995 water year."

SUMMARY OF SIGNIFICANT STREAMFLOW EVENTS

Water Year 1995 was a relatively eventful year for streamflow in and around Maricopa County. Many of the controlled and uncontrolled watersheds experienced multiple incidents of notable storm-generated streamflow. Significant winter-type events occurred in January, February, and March. The February event was the largest and most broadly felt of these events statewide. In addition to significant releases from the Salt River Project reservoirs into the Salt River through the Phoenix metropolitan area, large flows were also recorded on the Hassayampa River, Cave Creek, and the New River. The maximum impoundment for the year for New River Dam (1,956 ac-ft) resulted from the February streamflows. Cave Buttes Dam, on the other hand, experienced its maximum impoundment for the year (2,633 ac-ft) after the January event. January also saw maximum flows and impoundments in several of the east Valley structures.

The summer monsoon also produced several storms of note which produced streamflow monitored by the Flood Control District ALERT System. Three summer storms were especially noteworthy for their combination of both rainfall depth and high rainfall intensities which resulted in moderate flows in several areas. These storms occurred on 8/14-15, 8/19-20, and 9/27-28 of 1995. The storm of August 14th-15th caused maximum impoundments in both Sunset and Sunnycove Flood Retarding Structures in Wickenburg. The storm of the 19th-20th of August resulted in over 1,000 cfs discharging from the Arizona Canal Diversion Channel (ACDC) into Skunk Creek. However, the largest flow this water year in the ACDC occurred on the 28th of September when over 1,500 cfs passed under the 67th Avenue bridge. Cave Buttes Dam also impounded to over 18 feet as a result of this storm. The magnitude and duration of the September storm caused stormwaters to continue to flow downstream through the Agua Fria River and beyond the Gila River at Estrella Parkway gage site. The September storm also produced the annual peak discharge for Indian Bend Wash at McKellips Road (1,870 cfs). This was the same event which caused rather significant flooding of homes in southwest Scottsdale along the Cross Cut Canal.

Some of the other significant flows and/or impoundments for Water Year 1995 are summarized in the following table.

Maximum Flows and Impoundments for Selected FCDMC Water Level Sensor Locations

Note: Receeding limbs of hydrographs greatly affected by clogging of the outlet orifice. Therefore, low flows for falling hydrographs may be unrealistically high. See downstream stations 4823 and 5523 for a better representation of the falling limbs.

APPENDIX

No FCDMC ALERT System water level data were revised for Water Year 1994. However, the 1994 Surface Water Report did contain data from the USGS/FCDMC cooperative gages. Persons interested in data for these gages for Water Year 1994 should henceforth refer to *USGS Water-Data Report AZ-94-1*.

The cooperative gages in the FCDMC Surface Water Report for Water Year 1994 were:

<u>USGS Gage Name</u>	<u>FCDMC ID</u>	<u>USGS ID</u>
Vekol Wash near Stanfield, AZ	6983	09488650
Salt River at Priest Drive	4523	09512165
Cave Cr. below Cottonwood Cr.	4923	09512280
Agua Fria River at El Mirage	5503	09513650
Skunk Creek near Phoenix, AZ	5568	09513860
New River near Glendale, AZ	5508	09513910
Gila River @ Estrella Parkway	6853	09514100
Centennial Wash at SPRR	5103	09517490
Sauceda Wash near Gila Bend, AZ	6923	09519760
