**ANNUAL HYDROLOGIC  
DATA REPORT**

**VOLUME II  
SURFACE WATER DATA**

**WATER YEAR 2003**

## PREFACE

This publication presents the surface water data collected by the Flood Control District of Maricopa County's automated water-level gage network. This telemetered network is located primarily throughout Maricopa County, Arizona with additional gages in Yavapai, Pinal, and La Paz Counties.

The surface water data contained in this report were collected, compiled and edited by the Flood Warning Branch of the Engineering Division. Data include mean daily, total, maximum, and minimum discharges at the flow sites; mean daily, maximum, and minimum pool levels at the storage locations; and mean daily, maximum, and minimum volumes stored at the storage locations. Also included are maximum discharges, pool levels, and storage volumes for flood events of interest at each site. In addition, a few hydrographs from significant floods are also presented. Furthermore, flood flow frequency tables are included at sites where information is available either from statistical analysis of gage records or from rainfall/runoff models. These estimates of flood flow frequency do not necessarily correspond to regulatory discharges for the channel reaches near the gage sites. Always refer to official regulatory documents for such discharge information.

The information contained herein is as accurate and complete as possible within the limitations of real-time data collection technology currently available. Wherever possible, notes have been included to identify questionable data. Reliance upon the accuracy, reliability, and authority of this information is solely the responsibility of the user.

Revisions to any of these data for any reason will be published in the following years' reports immediately following the data for the current year for the site where the revisions have been made.

New features of this report compared with previous years' reports are the hyperlinks available in the electronic formats of this report. Hyperlinks are available for all USGS and FCDMC gages. Selection of a hyperlink will lead the user to the corresponding on-line information page for that gage. Furthermore, the tables of contents are now bookmarked to lead the user directly to the desired page.

Additional copies of this report may be purchased from:

## INTRODUCTION

The Flood Control District of Maricopa County in cooperation with federal, state, and local agencies collects a large amount of data pertaining to surface water runoff in and around Maricopa County. These data provide a valuable resource for information not otherwise furnished by the traditional sources of this type of material. To make these data readily available to interested parties outside the Flood Control District, the data are published annually in this report entitled "Annual Hydrologic Data Report, Volume II -- Surface Water Data." If this document is viewed on-line, hyperlinks lead to more information.

This report includes records on discharge at stream gages and at flood control storage structures, on depths at flood control storage structures, and on contents at flood control storage structures. Specifically it contains: (1) Streamflow records at 87 stream gages and 40 flood control storage structures; (2) Pool levels of stored water at 43 flood control storage structures; and (3) Storage volumes at 43 flood control storage structures where stage-storage relationships are available. Records included are only averages of data collected at each site during this water year.

Several streamflow gages are operated cooperatively between the FCDMC and the United States Geological Survey (USGS). Although real-time data for these sites are collected by the FCDMC ALERT System for the purposes of flood event monitoring, quality control for the data at these gages lies with the USGS. The official records for these sites are published in the USGS Surface Water Data Reports each water year or for current data go to <http://az.water.usgs.gov/>. The cooperative gages collected jointly for Water year 2003 were:

<u>USGS Gage Name</u>	<u>FCDMC ID</u>	<u>USGS ID</u>
<a href="#">Gila River near Maricopa, AZ*</a>	0788	09479350
<a href="#">Salt River at Priest Drive</a>	4523	09512165
<a href="#">Cave Cr. below Cottonwood Cr.</a>	4923	09512280
<a href="#">Skunk Creek near Phoenix, AZ</a>	5568	09513860
<a href="#">Gila River @ Estrella Parkway</a>	6853	09514100
<a href="#">Hassayampa River nr Morristown</a>	5223	09516500
<a href="#">Centennial Wash at SPRR</a>	5103	09517490

\*Gage is a cooperative between ADOT and USGS.

There are three additional continuous cooperative gages which the USGS operates, but are not ALERT equipped.

<u>Gage Site Name</u>	<u>USGS ID Number</u>
<a href="#">Indian Bend Wash at Curry Drive, Tempe</a>	09512162
<a href="#">New River near Rock Springs</a>	09513780
<a href="#">Hassayampa River near Arlington</a>	09517000

In addition to the continuous cooperative stations, the FCDMC also cooperates with the USGS in the collection of peak discharges at a number of crest stage gage sites. The data for these crest stage gage sites are also published by the USGS in their Surface Water Data Reports each water year.

The cooperative crest-stage gage sites for Water Year 2003 were:

<u>Gage Site Name</u>	<u>USGS ID</u>
<a href="#"><u>Vekol Wash near Stanfield, AZ</u></a>	09488650
<a href="#"><u>Tortilla Creek at Tortilla Flat</u></a>	09501300
<a href="#"><u>Camp Creek near Sunflower</u></a>	09510170
<a href="#"><u>Rock Creek near Sunflower</u></a>	09510180
<a href="#"><u>Indian Bend Wash at Shea Blvd</u></a>	09512090
<a href="#"><u>Salt River Trib in South Mountain Park</u></a>	09512200
<a href="#"><u>Agua Fria R. Trib. No. 2</u></a>	09512700
<a href="#"><u>Deadman Wash near New River</u></a>	09513820
<a href="#"><u>Waterman Wash near Buckeye</u></a>	09514200
<a href="#"><u>Hartman Wash near Wickenburg</u></a>	09515800
<a href="#"><u>Ox Wash near Morristown</u></a>	09516600
<a href="#"><u>Jackrabbit Wash near Tonopah</u></a>	09516800
<a href="#"><u>Centennial Wash Trib. nr Wenden</u></a>	09517200
<a href="#"><u>Tiger Wash near Aguila</u></a>	09517280

<a href="#"><u>Rainbow Wash Trib. near Buckeye</u></a>	09519600
<a href="#"><u>Bender Wash near Gila Bend</u></a>	09519750
<a href="#"><u>Sauceda Wash near Gila Bend</u></a>	09519760
<a href="#"><u>Military Wash near Sentinel</u></a>	09520100
<a href="#"><u>Crater Range Wash near Ajo</u></a>	09520230
<a href="#"><u>Star Wash</u></a>	09516790

ALERT water-level sensors are located on two Corps of Engineers structures. Tat Momolikot and Whitlow Ranch Dams are monitored by the Corps of Engineers. Again, these data are collected in real-time by the FCDMC for the purpose of flood monitoring. The District will publish data for Tat Momolikot since data are no longer collected by the Corps. Please refer to the Los Angeles District office for official data for Whitlow Ranch Dam at <http://www.spl.usace.army.mil/resreg/>.

This is the tenth annual surface water report published by the District. Prior to water year 1994, surface water data collected by the FCDMC ALERT System were not quality controlled, and therefore, not published. However, there are data resident in archives prior to water year 1994 that may have value to specific individuals. Data are available back to November 1987 for some streamflow sites.

The data are collected as a depth of flow in feet (or stage). The discharge and/or contents is then obtained by applying the stage to a rating curve of stage versus discharge in cubic feet per second (cfs), or stage versus contents in acre-feet (ac-ft). The discharge rating curves have been developed at stream gages by using field surveyed cross sections in a HEC-2 or HECRAS step backwater computer model to obtain a range of stage versus discharge points to be plotted on a curve. These step backwater ratings are refined whenever possible using direct and/or indirect measurements made at or near the gage site. For flood control storage structures, discharge ratings were obtained in one of two ways. First, the design ratings may be used. In most cases however, the discharge rating curves were developed by application of the Federal Highway Administration's HY-8 computer model for culvert flow and U.S. Geological Survey methods for weir flow over the uncontrolled emergency spillways. The storage rating curves were obtained from published as-built or construction plans or developed from digital elevation data.

Daily mean discharges are computed by applying the daily mean stages (gage heights) to the stage-discharge curves or tables. The same is similarly true for storage facility contents. The minimum and maximum values are based on instantaneous readings and the volumes for discharge stations are based on accumulations of daily means. Those gages in section 2, Pool Levels at Storage Facilities, which show a continuous gage height during obvious periods of no storage, do so because the orifice to the pressure transducer is set at that gage height above or below 0.0 feet gage datum.

All data in this report have been reviewed and edited in an attempt to provide the most accurate data possible. A blank or blanks within the data set is an indication that data was lost either due to hardware, software, or radio problems, or that the gage had not yet been installed. Where possible, these data are flagged with footnotes describing the time the gage was down. In the event that published records require revision, revisions are printed in later reports. Listed in the heading for each gage where records have been revised are all the reports in which revisions have been published for the station and the water years to which the revisions apply (e.g. WY1999: WY1994-95 means that the data for Water Years 1994-1995 were revised in the report for Water Year 1999).

Comments about this report or errors discovered may be forwarded to the Flood Warning Branch using the comment/errata sheet found at the back of this document. Alternately, comments or errors may be sent via Internet e-mail from the FCDMC ALERT System Home Page or directly to [deg@mail.maricopa.gov](mailto:deg@mail.maricopa.gov).

An index of gage names, numbers, locations, and other descriptors is included following the Definition of Terms in this report.

Additional or more detailed surface water data in hard copy or computer disk format is available for the gages listed in this report. Furthermore, data is available on the FCD ALERT internet site at <http://www.fcd.maricopa.gov/Services/ALERT/default.asp>. For information, contact the Flood Control District, Engineering Division, Flood Warning and Data Collection Branch at (602) 506-1501.

## DEFINITION OF TERMS

Terms related to streamflow and other hydrologic data, as used in this report are defined below.

Acre-foot (ac-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,560 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool.

Control designates a feature downstream from the gage that determines the stage-discharge relation at the gage. This feature may be a natural constriction of the channel, an artificial structure, or a uniform cross section over a long reach of the channel.

Control structure as used in this report is a structure on a stream or canal that is used to regulate the flow or stage of the stream.

Cubic foot per second (cfs) is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to approximately 7.48 gallons per second or 448.8 gallons per minute or 0.02832 cubic meters per second.

Cubic foot per second-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, or about 646,000 gallons or 2,445 cubic meters.

Daily mean discharge is the average discharge in cfs for a 24 hour period from midnight to midnight the following day.

Discharge is the volume of water (or more broadly, total fluid plus suspended sediment), that passes a given point within a given period of time.

Drainage area of a stream at a specified location is that area, measured in a horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the stream above the specified point.

Drainage basin is a part of the surface of the Earth that is occupied by a drainage system, which consists of a surface stream or body of impounded surface water, together with all tributary surface streams and bodies of impounded surface water.

El Niño is a condition where sea surface temperatures are warmer in the eastern Pacific Ocean and cooler in the western Pacific Ocean in the lower latitudes. Normal conditions of sea surface temperatures are opposite with warmer waters in the western Pacific and cooler waters in the eastern Pacific. El Niño conditions usually result in higher than normal precipitation in the southwestern United States.

Flood Elevation Frequency refers to the magnitude (in terms of depth or elevation) and probability of floods at a given flood control impoundment structure. The flood elevation frequency is usually given as a depth or elevation of impoundment associated with a given recurrence interval at a particular flood control impoundment structure.

Flood Flow Frequency refers to the magnitude (in terms of peak discharge) and probability of floods at a given gaging station. The flood flow frequency is usually given as a peak discharge associated with a given recurrence interval at a particular gaging station.

Gage datum is the elevation of the zero point of the reference gage from which gage height is determined. This elevation is established by a system of levels from known bench marks or by approximation from topographic maps or arbitrarily established to a known point such as a culvert invert elevation.

Gage height is the water-surface elevation referred to some arbitrary gage datum. Gage height is often used interchangeably with the more general term "stage," although gage height is more appropriate when used with a reading on a gage.

Gaging station is a particular site on a river, stream, canal, lake, or reservoir where systematic observations of hydrologic data are obtained.

Instantaneous discharge is the discharge at a particular instant of time.

La Niña is when above normal sea surface temperatures exist in the western Pacific Ocean and cooler than normal sea surface temperatures exist in the eastern Pacific Ocean. La Niña conditions usually result in drier than normal conditions in the southwestern United States.

Maximum Level is the highest pool level recorded or observed at a particular gaging station at a flood control impoundment structure for a given event.

Maximum Storage is the greatest volume of water stored behind or within a flood control impoundment structure for a given event. This occurs at the maximum pool level and is obtained from the stage-storage relation for that maximum level for a particular flood control impoundment structure.

Mean discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period.

National Geodetic Vertical Datum of 1929 (NGVD 1929) is a geodetic datum derived from a general adjustment of the first order level nets of both the United States and Canada. It was formerly called "Sea Level Datum of 1929" or "mean sea level." Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place.

North American Vertical Datum of 1988 (NAVD 1988) is a datum based on the mass or density of the Earth instead of the varying values of the heights of the seas. Measurements of the acceleration of gravity are made at observation points in a network. Only one point is defined as the datum point. The vertical reference surface is then defined by the surface on which the gravity values are equal to the datum point value. This is called an equipotential surface.

Peak Discharge is the maximum instantaneous discharge for a given flood event.

Period of Record is the time period for which data exists for a given stream gaging station.

Pressure transducer is an instrument used to measure the depth of water. It is an analog instrument which measures a pressure change over a diaphragm. The depth of water is related to the change in pressure over the diaphragm created by the weight of the water over the instrument.

Recurrence interval is the reciprocal of the probability of a flood occurring in any given year. Thus, the flood having a 1% (1/100, or 1 in 100) chance of occurring in any given year has a recurrence interval of 100 years and is referred to as the 100-year flood. Similarly, the flood having a 50% (1/2 or 1 in 2) chance of occurring in any given year has a recurrence interval of 2 years and is referred to as the 2-year flood.

Staff gage is a device located at the gaging station to provide a visual reference to the depth of water at a gage in terms of gage height above the water level measuring instrument.

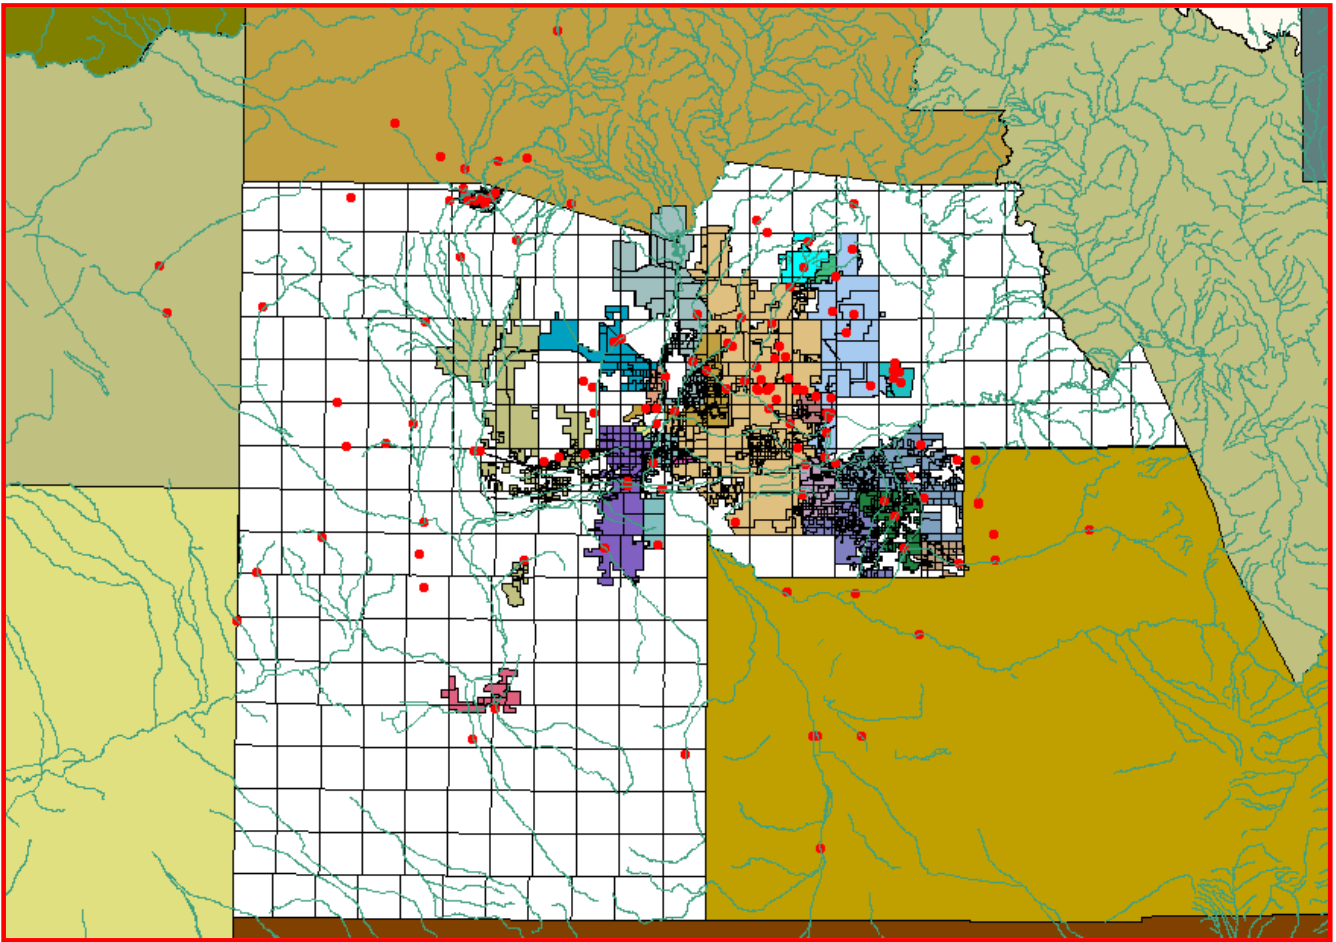

Stage-discharge relation is the relation between gage height (stage) and the volume of water, per unit of time, flowing in a channel.

Stage-storage relation is the relation between gage height (stage) and the volume of water stored behind or within a flood control impoundment structure.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff" as streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Water year dealing with surface-water data is the 12-month period, October 1 through September 30. The water year is designated by the calendar year in which it ends and which includes 9 of the 12 months. Thus, the water year beginning October 1, 2002 and ending September 30, 2003, is called the "2003 Water Year."

# FCD STAGE GAGE LOCATIONS – WY 2003

## New Installations in Water Year 2003

Four new streamgages were installed during Water Year 2003. The table below lists the new gages installed this past year.

ID #	Gage Name	Installed	T-R-S	Latitude	Longitude	Elev.	Page #s
4893	<a href="#">Cave Creek</a>	05/29/03	6N-4E-29	33 49 48	111 58 04	1995	<a href="#">1:46-47</a>

## **SUMMARY OF SIGNIFICANT STREAMFLOW EVENTS**

Water Year 2003 began with the promise of an on-coming El Nino event. Several small storm events occurred in October and November. Several washes flowed during the October event such as Fourth of July Wash and Jackrabbit Wash. Small events continued through December and January with a bit more frequency. Not until February did the El Nino generated events take hold.

A large winter storm entered Arizona on February 13 and continued into February 14. Rainfall totals for the event were from one inch to nearly five inches in the Bradshaw Mountains. Significant runoff occurred in many areas, with some gages recording their peak discharge since installation. The Indian Bend Wash and Arizona Canal Diversion Channel gages recorded significant runoff. Western Maricopa County also received significant rainfall. The largest recorded flow on Delaney Wash occurred during the event.

The summer monsoon began in late July and was all but over by early September. Western Maricopa County appears to have received the most significant rainfall and thus runoff during the summer 2003. Record runoff occurred at Copper Wash, Cruff Wash, and Fourth of July Wash. Other gages in the west county received record or near record runoff amounts. Eastern Maricopa County received a small share of rainfall during the summer. Only the EMF at Broadway recorded any amount of runoff.

The Water Year ended with a relatively dry September. A few rain/runoff events occurred in early September, but little rain fell after September 10.

## DATA PRESENTATION

The following three sections present the data collected by the Flood Control District ALERT system. The first section is Surface Water Streamflow data. This section contains data from free-flowing stream sites and discharges from dams and detention basins. The second section contains Pool Level data from storage structures, both dams and basins. The third section presents Storage Volume data for both dams and basins. The data are in acre-feet of storage volume.

In the tables where there are dashes “- -” for a particular date or dates, the gage was down. Typically a gage is down when the gage itself fails, or a transmitter or repeater fails. In the case of transmitter failure or repeater failure, data for that date is available by manual download. However, when no event has occurred, the data will typically not be retrieved from the device.

In the electronic version of this document, gage names have been hyperlinked to the corresponding internet page on the FCDMC ALERT web site. Select any hyperlink if more detailed information about the gage is desired.

**NOTE: Receding limbs of hydrographs are greatly affected by clogging of outlet orifice. Therefore, low flows for falling hydrographs may be unrealistically high. See downstream stations 4823 and 5523 for a better representation of the falling limbs. Weir flow begins into main channel above 10 feet gage height.**

**NOTE: Severe drop at boulders along the downstream side of Buckeye Road bridge as well as two channels for lower flows introduce considerable error into the rating for flows less than about 3,500 cfs. The multiple channels also mean some lower flows are missed by the gage.**

**NOTE: Gage removed at the request of MCDOT for bridge repair. Gage removed from September 15, 2003 through September 30, 2003.**

## Flood Control District of Maricopa County ALERT System Computation of Continuous Records of Streamflow

**Station Number:** 5508      **Name:** [NewRiver @ Glendale](#)  
**Drainage Area:** 600 mi<sup>2</sup>, of which 191 mi<sup>2</sup> is controlled by Cave Buttes Dam, 164 mi<sup>2</sup> by New River Dam, and 90 mi<sup>2</sup> by Adobe Dam.  
**Period of Record:** FCDMC: October 1, 1998 to current year\*  
 USGS: through WY1998 (09513910)  
**Revised Records:** WY2000:WY1999  
*Discharge, in cfs, Water Year 2003 --- October 2002 to September 2003*

### *Peak flows of interest during Water Year 2003*

<u>Day</u>	<u>Peak</u>	<u>Discharge (cfs)</u>	<u>Gage Ht. (feet)</u>	<u>Day</u>	<u>Peak</u>	<u>Discharge (cfs)</u>	<u>Gage Ht. (ft.)</u>
02/13		1,783	1.90	02/15*		6,250	3.10
02/25		420	1.30	03/17		298	1.25
08/14		354	1.27				

**\*NOTE:** The peak recorded by the recording stage gage during the events of February 2003 was 1.90 feet gage height, and 1,783 cfs. However, field reconnaissance of crest-stage gage data and debris lines indicated that a peak occurred somewhere around February 15 or 16 at a peak stage of 3.10 feet gage height, and 6,250 cfs. The 1.90 feet peak occurred before the large flows in the ACDC had occurred. Along with the large flows in the ACDC, several other channels including an ADOT channel carrying runoff from the 101 freeway had exceeded capacity. As a result, the peak is likely to have occurred.

\*Gage installed on December 21, 1998, replacing FCDMC gage #6863 at the old 115th Avenue Gila River crossing. Old gage was in service from November 6, 1997 until installation of new gage 6848.

\*\*An undetermined amount of flow occurs more or less continually at this location below the gage.

\* USGS maintained a crest stage gage at this location from 11/27/1963 to 09/30/1979. In 1990, a joint USGS/FCDMC continuous station was installed. The USGS continuous station was discontinued 10/01/1994. Since Water Year 1995, the continuous station has been operated by the FCDMC and the crest stage gage by the USGS.

\*\* See also USGS crest stage gage, 09519760, data for this site.

**\*NOTE:** Peak stage at recording gage was 2.97 feet and rated at 691 cfs. An indirect measurement and survey of high water marks indicated the peak stage at 3.73 feet but only 400 cfs. The rating was not changed as of WY 2003.

**\*\*NOTE:** Recording gage failed to record the event of August 15, 2003. Data were recovered from the crest-stage gage at the site.

Many days of impoundment due to irrigation tailwater. The gage is located inside a pump housing that, when stage reaches a certain level, pumps water from the gage house and basin. The daily stage values fluctuate substantially. Gage Heights above 10.0 feet are generally caused by storm events.

\*Gage ID was 0769 prior to January 24, 2000.

\*\*FCD Operated gage since January 1998. However, previous gage did not work properly. A pressure transducer gage was installed January 24, 2000 and all previous data were deleted. Previously, the US Army Corps of Engineers, Los Angeles District maintained a gage at this location.

See also Pool Level data.

Many days of storage from irrigation tailwater. The gage is located inside a pump housing that, when stage reaches a certain level, pumps water from the gage house and basin. The daily stage values fluctuate substantially. Gage Heights above 10.0 feet are generally caused by storm events.
